

# PRACTICAL NETWORK SECURITY PART 2

Kunwadee Sripanidkulchai, Ph.D.

kunwadee (AT) cp.eng.chula.ac.th

## RECAP LAST WEEK'S ACTIVITY

- ▶ Recon
  - ▶ Social engineering
  - ▶ nmap
- ▶ Prevention of recon

## ACTIVE OS FINGERPRINTING: HOW

- ▶ Different OS's have different TCP/IP behavior
- ▶ Send the target a bunch of 'crafted' TCP packets and observe the response
- ▶ Map back to known fingerprints to determine OS

# DEFENSES

remote (via the network)

PRETEND TO BE A USER

EXPLOIT VULNERABILITIES

ENCRYPTION

FIREWALL/IDS/IPS

REMOTE LOGIN SERVICES

OTHER NETWORK SERVICES

EDUCATION/AWARENESS

SYSTEM

HARDEN AGAINST PRIVILEGE ESCALATION

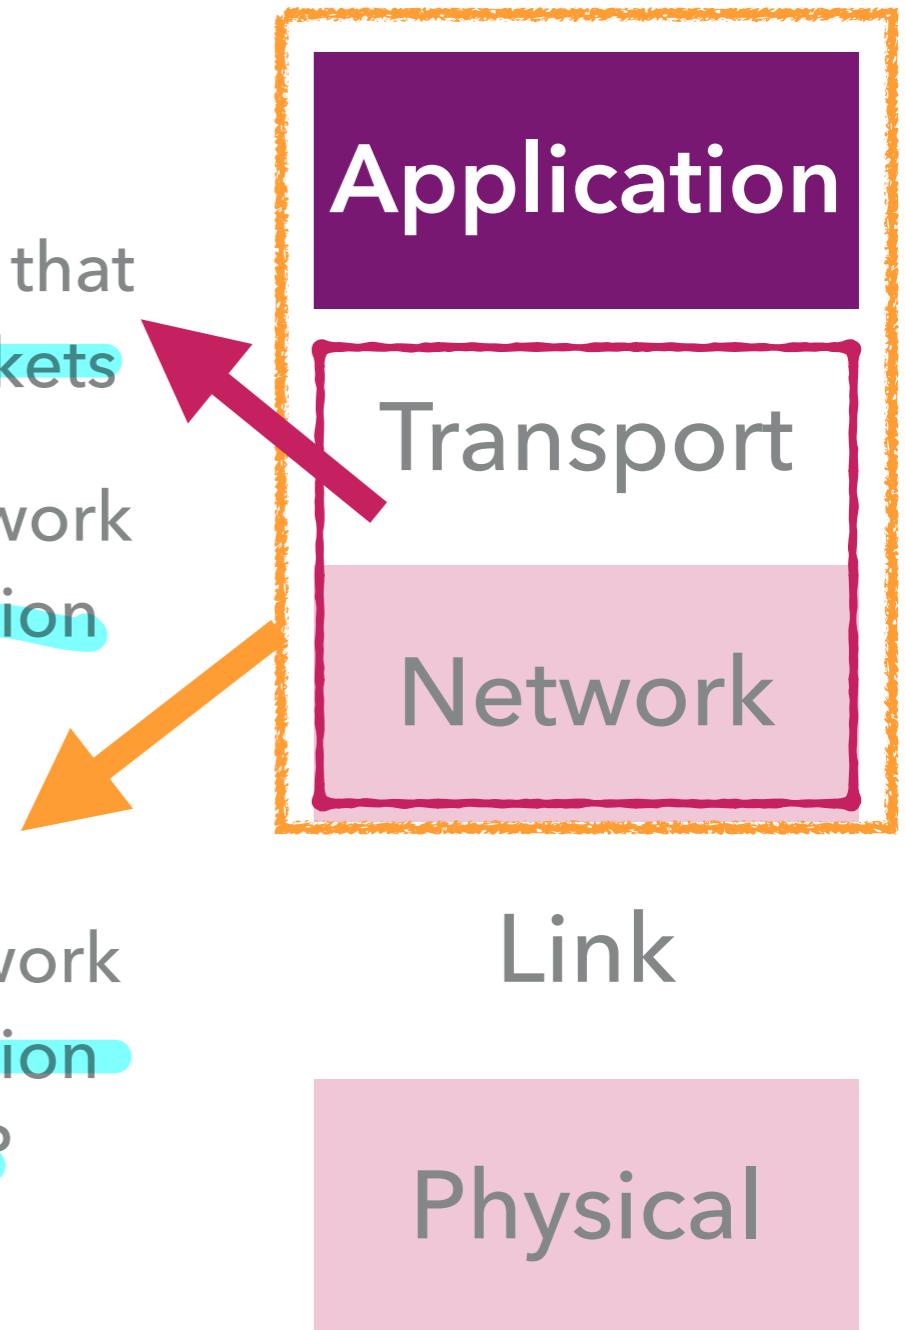

EXPLOIT VULNERABILITIES

PATCHES, SECURE CODING

## FIREWALL VS. INTRUSION DETECTION SYSTEM VS. INTRUSION PREVENTION SYSTEM

- ▶ Firewall: Analyze packet headers for IP addresses (network layer) and port numbers (transport layer) that match pre-configured rules to DROP/ACCEPT packets
- ▶ IDS: Analyze packet headers for IP addresses (network layer), port numbers (transport layer), and application data (application layer) that match rules and generates logs of the event
- ▶ IPS: Analyze packet headers for IP addresses (network layer), port numbers (transport layer), and application data (application layer) that match rules and DROP packets that match

## FIREWALL EFFECTIVENESS IS LIMITED

- ▶ Firewalls are a partial fix, but widely used.
- ▶ Issue: adversary may be within firewalled network.
- ▶ Issue: hard to determine if packet is "malicious" or not.
- ▶ Issue: even for fields that are present (src/dst), hard to authenticate.
- ▶ TCP/IP's design not a good match for firewall--like filtering techniques.
  - ▶ E.g., IP packet fragmentation: TCP ports in one packet, payload in another.

Keep in mind....

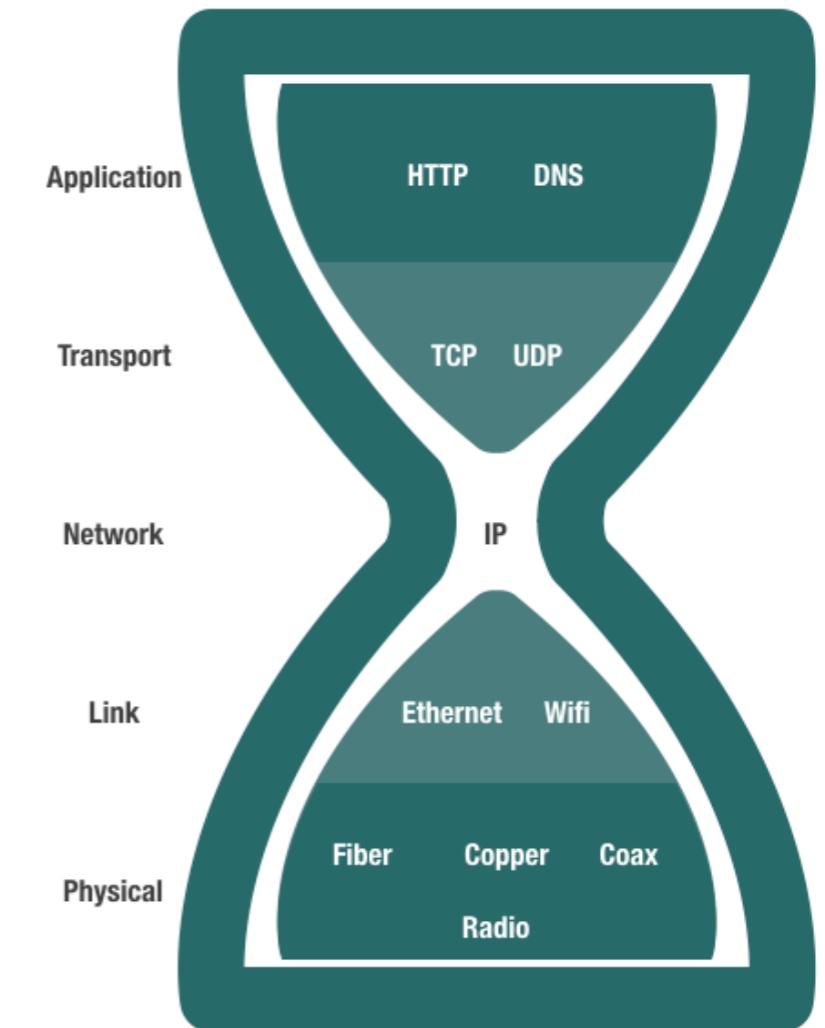

**SECURITY PROBLEM  
INHERENT IN THE DESIGN  
“PROTOCOL-LEVEL PROBLEM” VS.  
IMPLEMENTATION PROBLEM “BUG”**

## THREAT MODEL FOR NETWORK SECURITY

- ▶ Adversary can intercept / modify network traffic.
- ▶ Adversary can send packets.
- ▶ Adversary has full control of their own machines.
- ▶ Adversary can participate in protocols (usually).
  - ▶ Often not feasible to keep bad guys out of a large system.

# TRANSPORT LAYER

| Properties      | UDP | TCP |
|-----------------|-----|-----|
| Connections     |     |     |
| Packet boundary |     |     |
| Reliability     |     |     |
| Ordering        |     |     |
| Broadcast       |     |     |

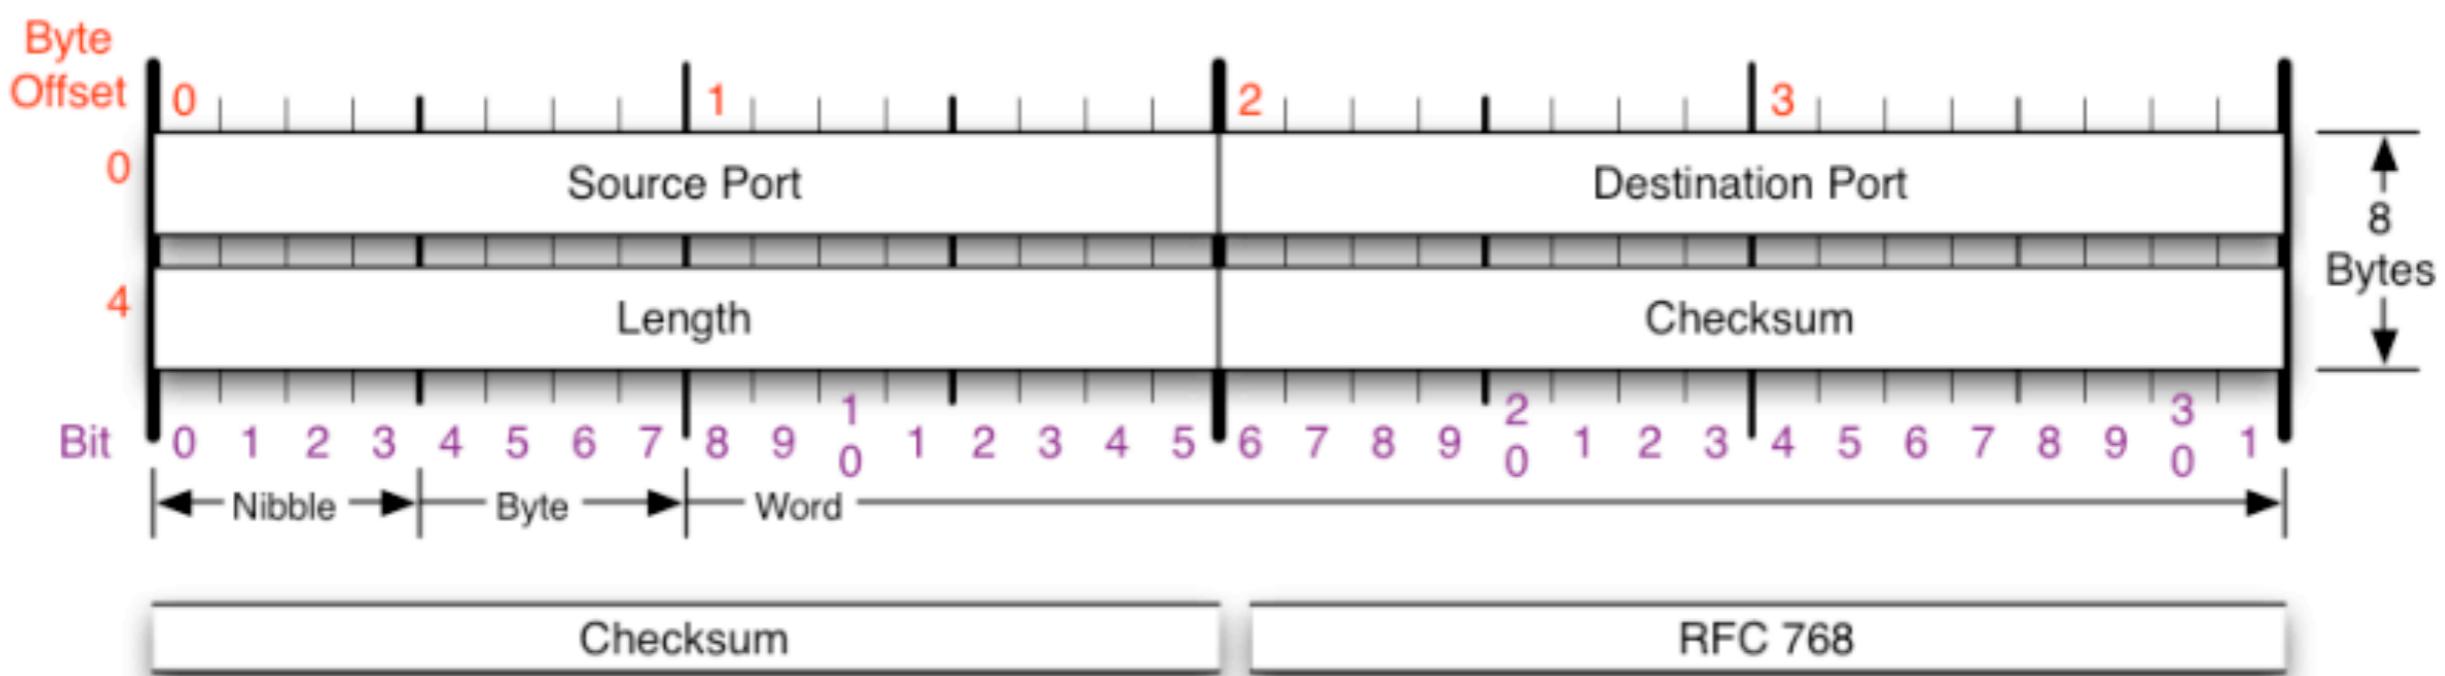

# PORT NUMBERS

- ▶ Each application (e.g., HTTP server) on a host is identified by a port number
  - ▶ IP address is the address of the host
  - ▶ Port number identifies the process (application) running on the host
- ▶ TCP connection established between port A on host X to port B on host Y
- ▶ Ports are 1-65535 (16 bits)
- ▶ Some destination port numbers used for specific applications by convention
  - ▶ 80 HTTP (Web)
  - ▶ 443 HTTPS (Secure Web)
  - ▶ 25 SMTP (mail delivery)
  - ▶ 67 DHCP (host config)
  - ▶ 22 SSH (secure shell)
  - ▶ 23 Telnet

# USER DATAGRAM PROTOCOL (UDP)

- ▶ Essentially a wrapper around IP
  - ▶ Follows IP's best effort service model
  - ▶ Adds ports to demultiplex traffic by application

Checksum of entire UDP segment and pseudo header (parts of IP header)

Please refer to RFC 768 for the complete User Datagram Protocol (UDP) Specification.

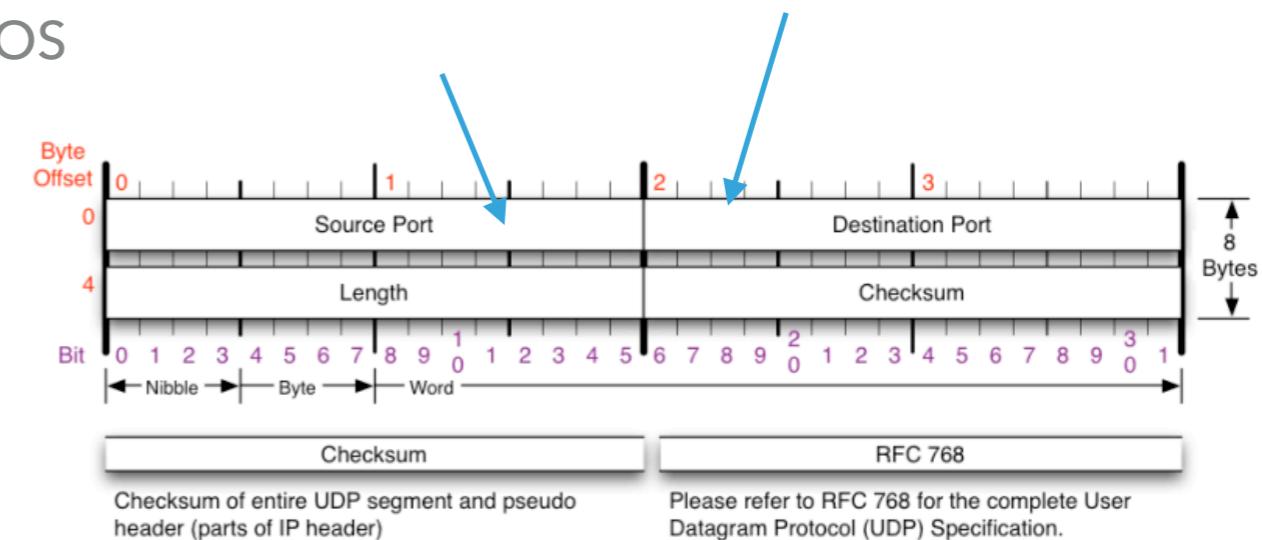

# UDP PORT NUMBERS

Client

Server

client's source port number is automatically assigned by the client's OS

server's port number (i.e., port 53)

- ▶ Common UDP applications
  - ▶ DNS
  - ▶ QUIC
  - ▶ Streaming/VoIP

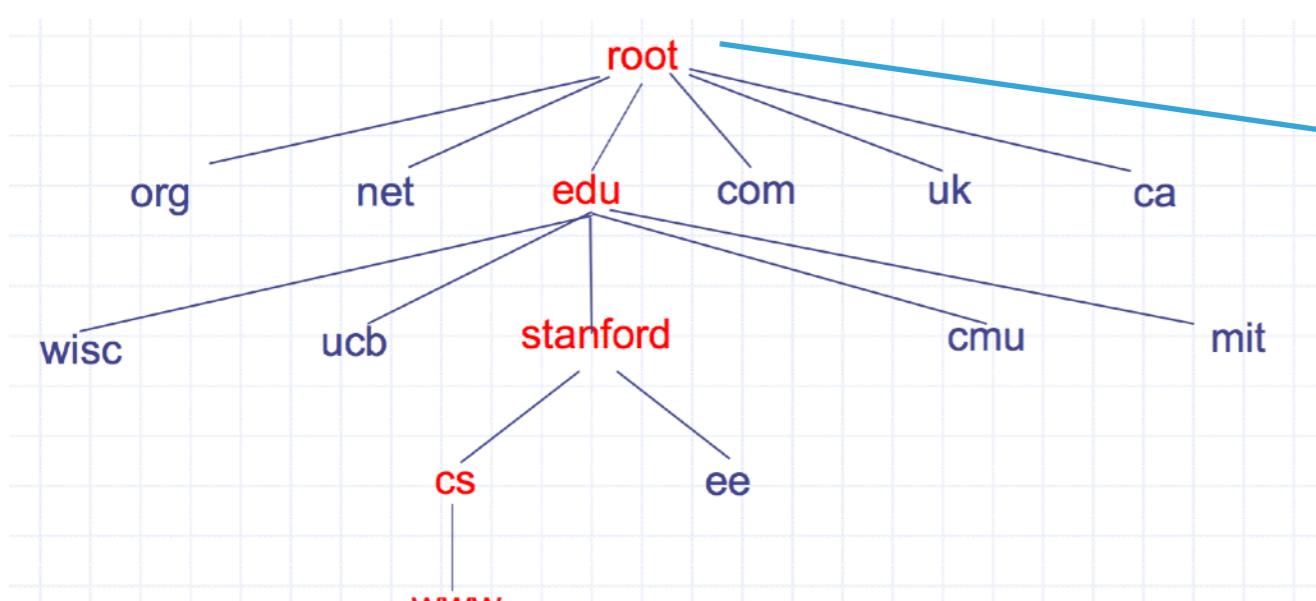

- 1. DNS CACHE POISONING**
- 2. DNS SPOOFING  
(KAMINSKY ATTACK)**
- 3. DNS REBINDING**
- 4. DOS/DDOS**

---

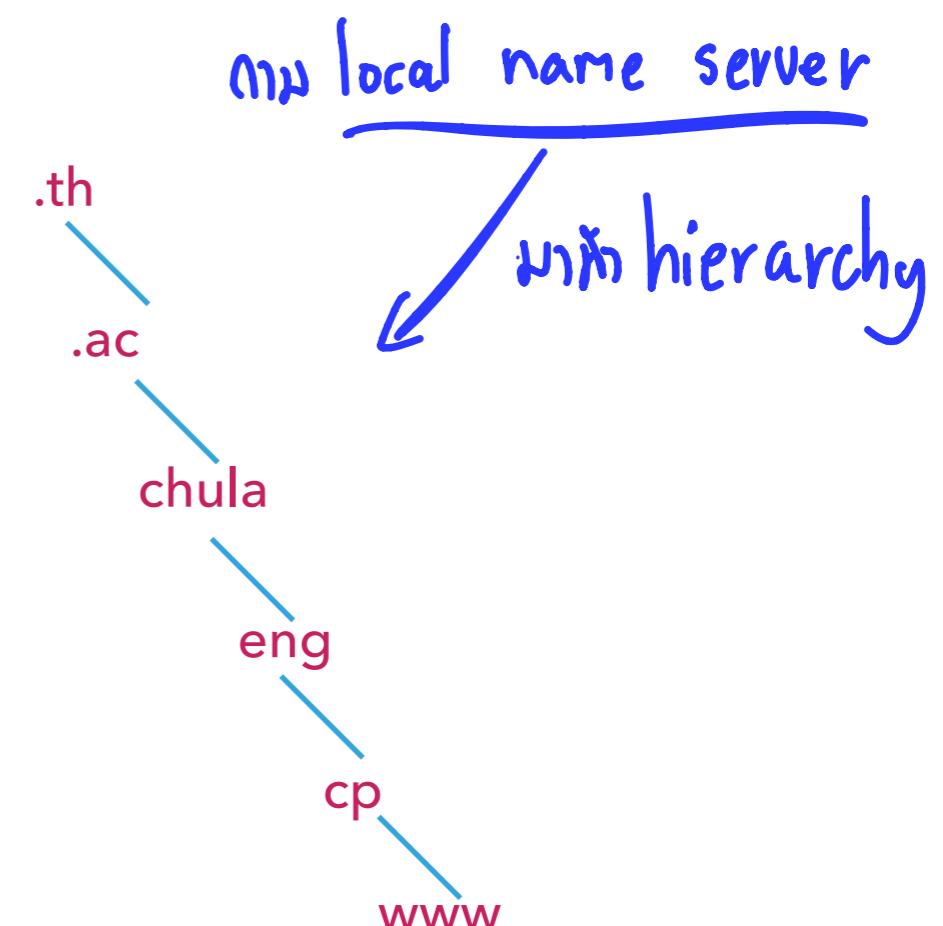

## UDP KNOWN ISSUES

## DOMAIN NAME SYSTEM (DNS)

- ▶ Application-layer protocols (and people) usually refer to Internet host by host name (e.g., google.com)
- ▶ DNS is a delegatable, hierarchical name space

[www.cs.stanford.edu](http://www.cs.stanford.edu)

[www.cp.eng.chula.ac.th](http://www.cp.eng.chula.ac.th)

## DNS RECORD

- ▶ A DNS server has a set of records it authoritatively knows about

```
% dig chula.ac.th NS

ผู้ให้บริการ  
(ผู้ให้บริการ DNS)

TTL  
cache time & DNS caching

# DNS CACHING

- ▶ DNS responses are cached
  - ▶ Quick response for repeated translations
- ▶ NS records for domains also cached
  - ▶ also
- ▶ DNS negative queries are cached
  - ▶ Save time for nonexistent sites, e.g. misspelling **ໜ້າວິທະນາຖາວອນ**
- ▶ Cached data periodically times out
  - ▶ Lifetime (TTL) of data controlled by owner of data
- ▶ TTL passed with every record

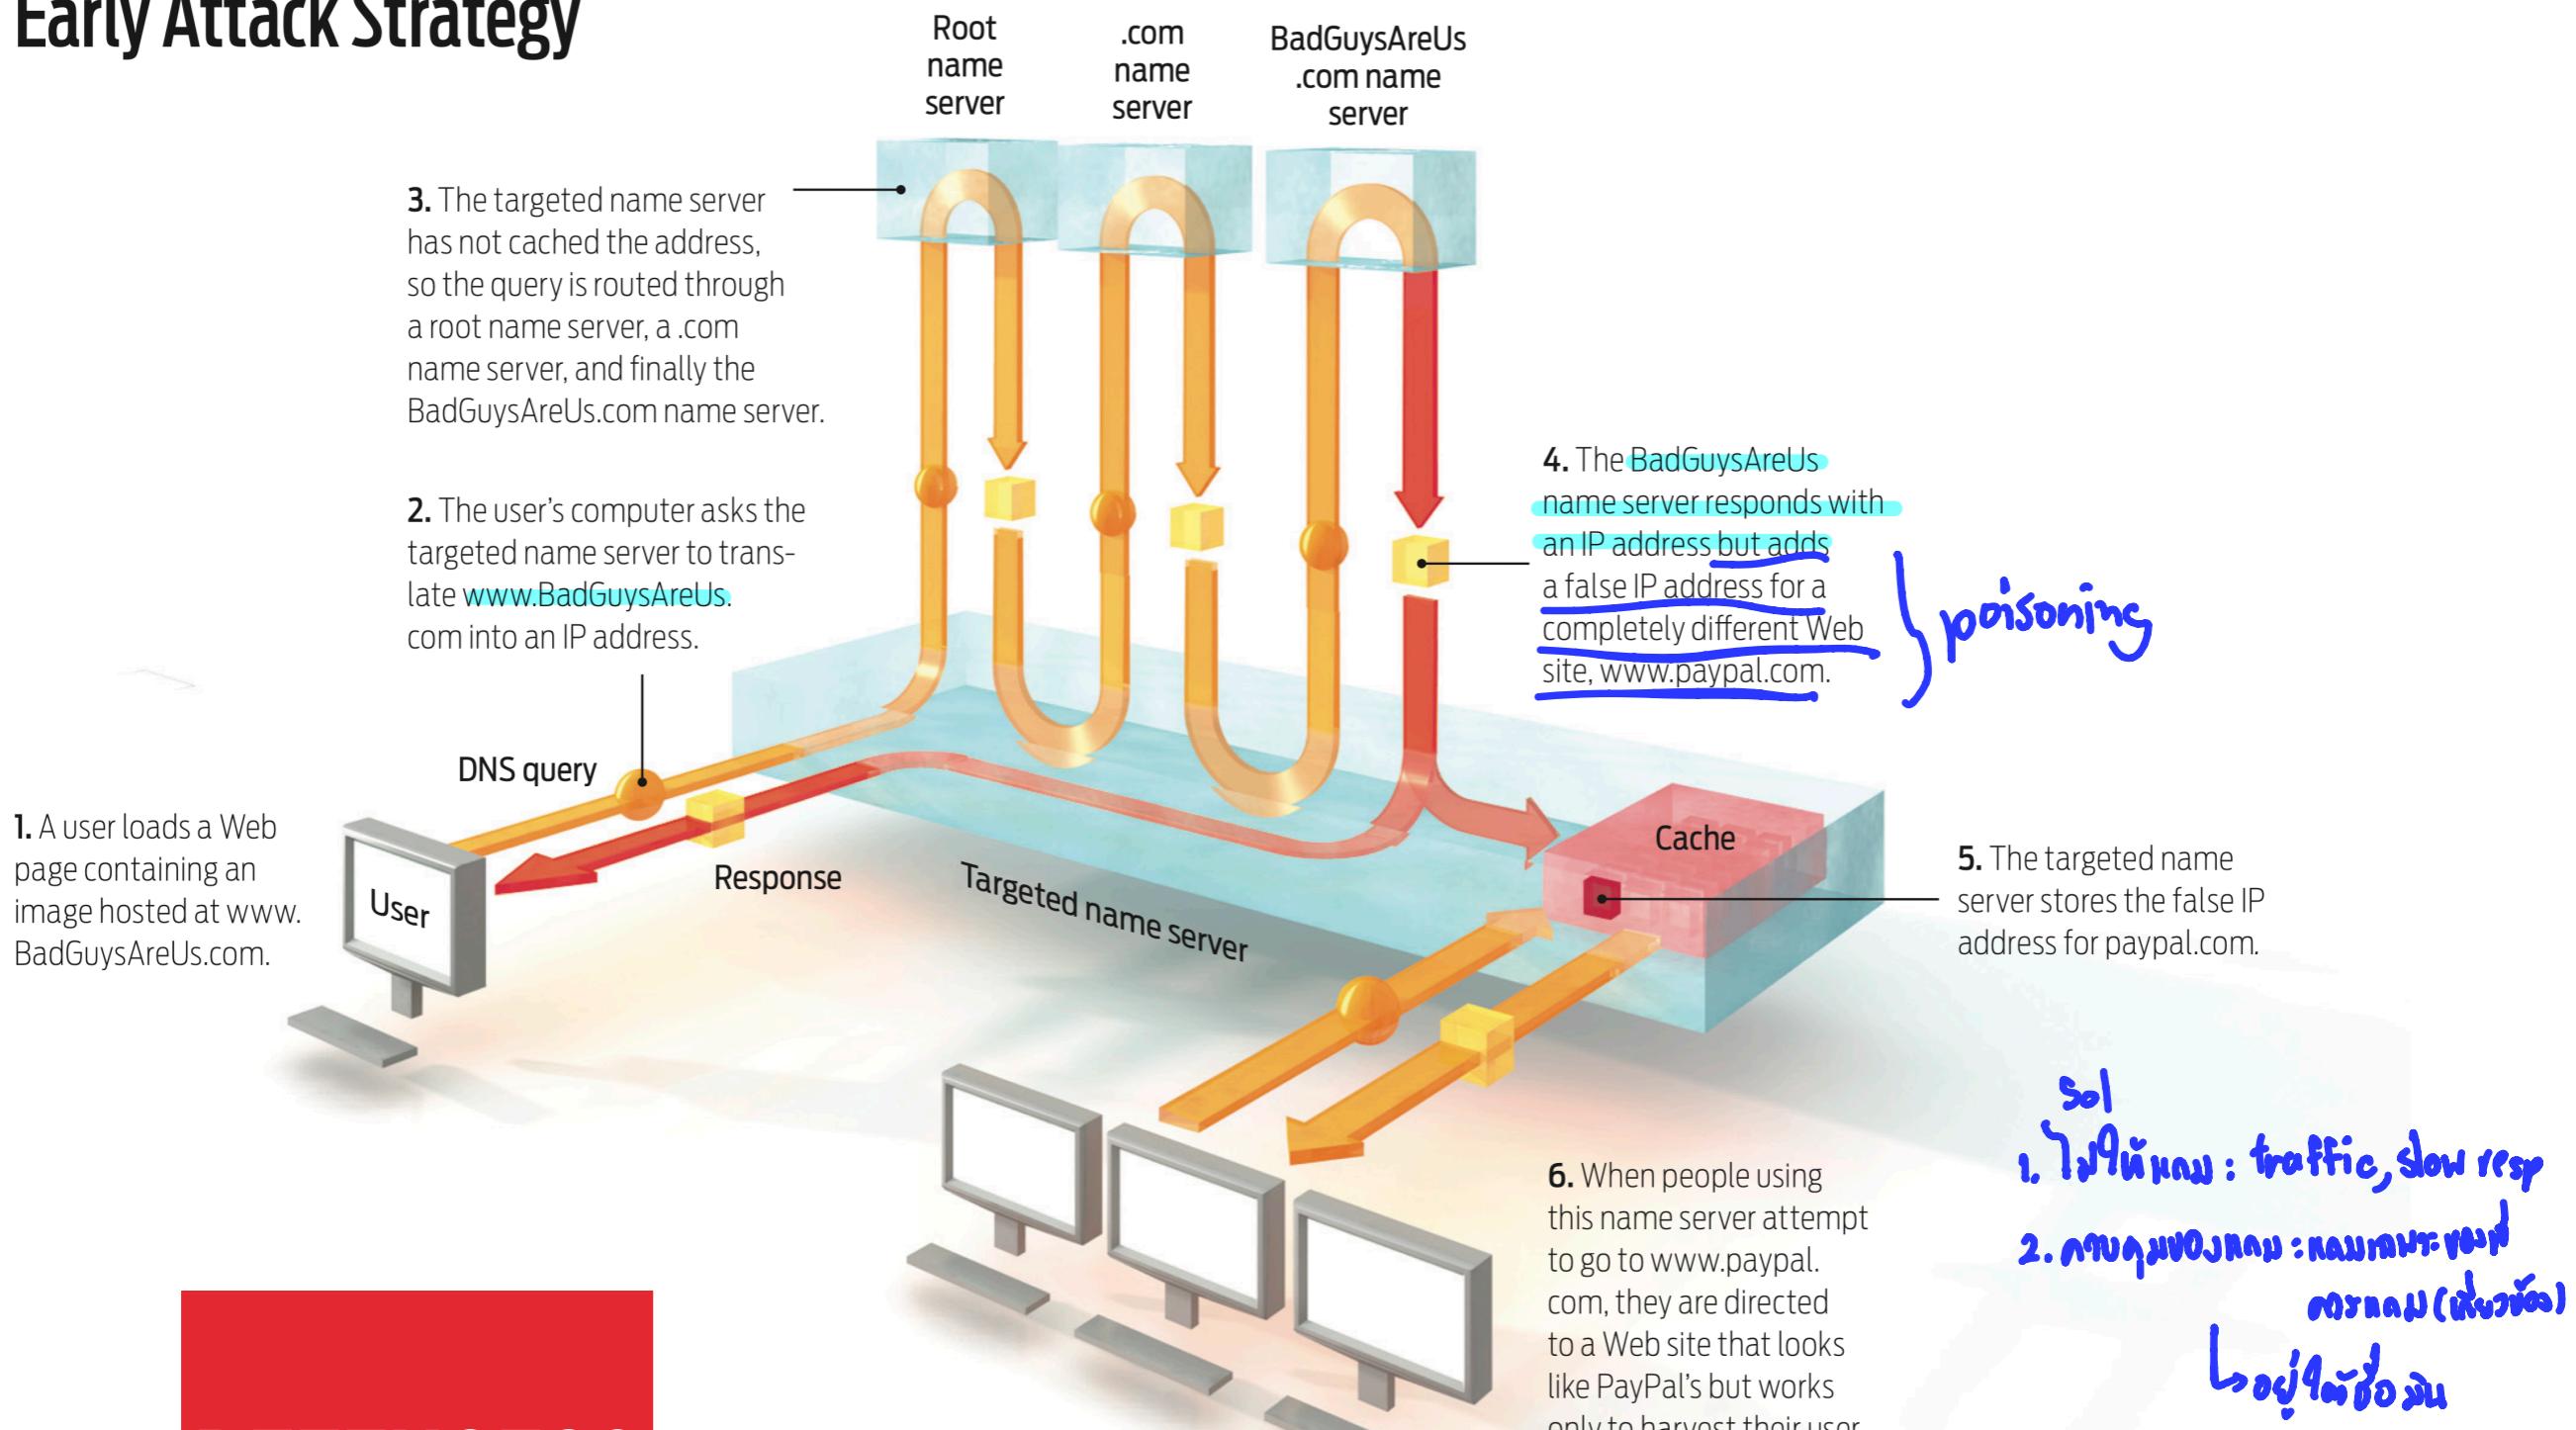

## DNS SECURITY

- ▶ **Users/hosts trust the host-address mapping provided by DNS**
- ▶ Used as basis for many security policies: Browser same origin policy, URL address bar
- ▶ Interception of requests or compromise of DNS servers can result in incorrect or malicious responses

# DNS CACHE POISONING

## Early Attack Strategy

**DEFENSES?**

## DNS CACHE POISONING ദൂഷണമാർക്കുന്ന DNS cache

- ▶ DNS query results include Additional Records section
  - ▶ Provide records for anticipated next resolution step
- ▶ Early servers accepted and cached all additional records provided in query response

## GLUE RECORDS Glue

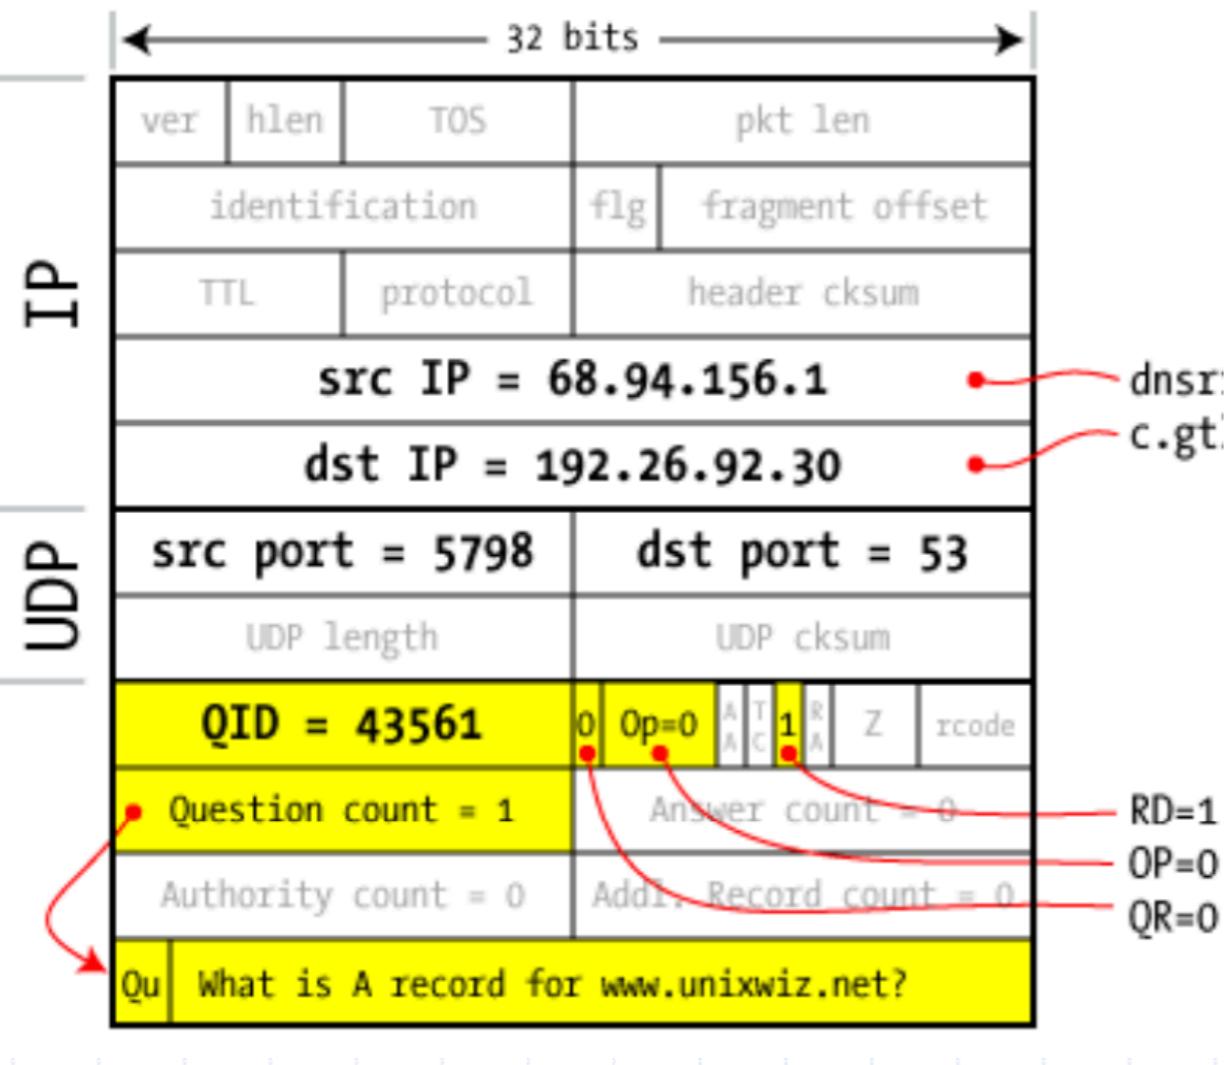

- ▶ Can we just stop using additional section?
  - ▶ Only accept answers from authoritative servers?
  - ▶ Glue records: non-authoritative records necessary to contact next hop in resolution chain
  - ▶ Necessary given current design of DNS
  - ▶ **Bailiwick Checking:** Only accept additional records that are for a domain in the original question.

## DNS SPOOFING

: កំណត់ពីរបាល DNS server  
នៅក្នុងមានសារ

- ▶ Scenario: DNS client issues query to server
- ▶ Attacker would like to **inject a fake reply**
  - ▶ Attacker does not see query or real response
  - ▶ **How does client authenticate response?**

## DNS SPOOFING

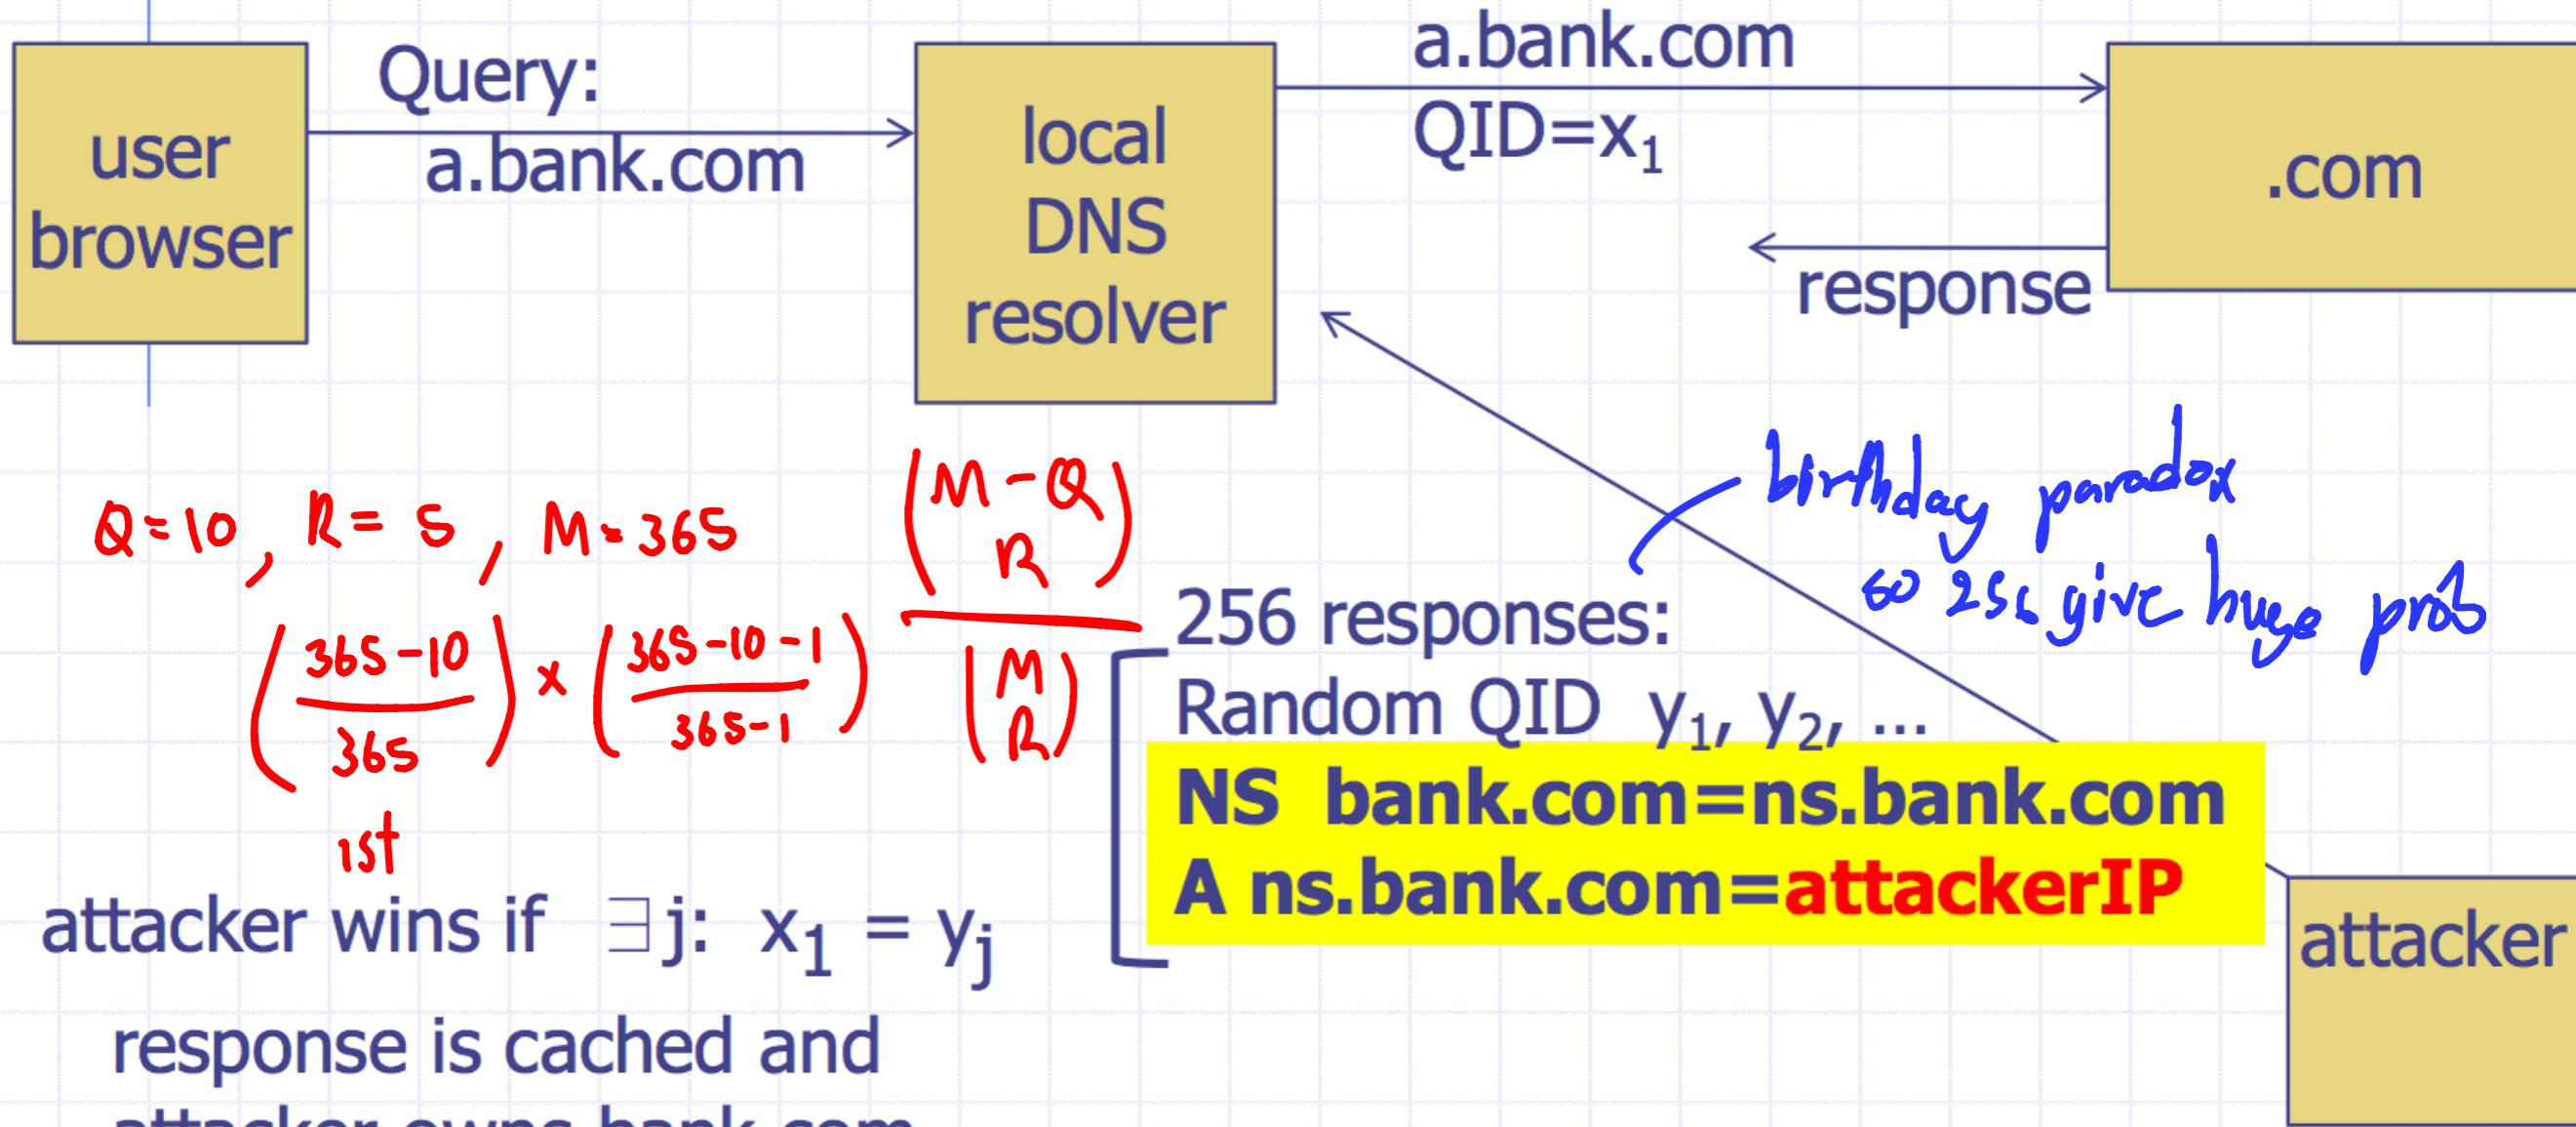

- ▶ How does client authenticate response?
- ▶ UDP port numbers must match
- ▶ Destination port usually port 53 by convention
- ▶ 16-bit **query ID** must match *only thing that need to match*

# DEFENSES?

## KAMINSKY ATTACK

- ◆ Victim machine visits attacker's web site, downloads Javascript

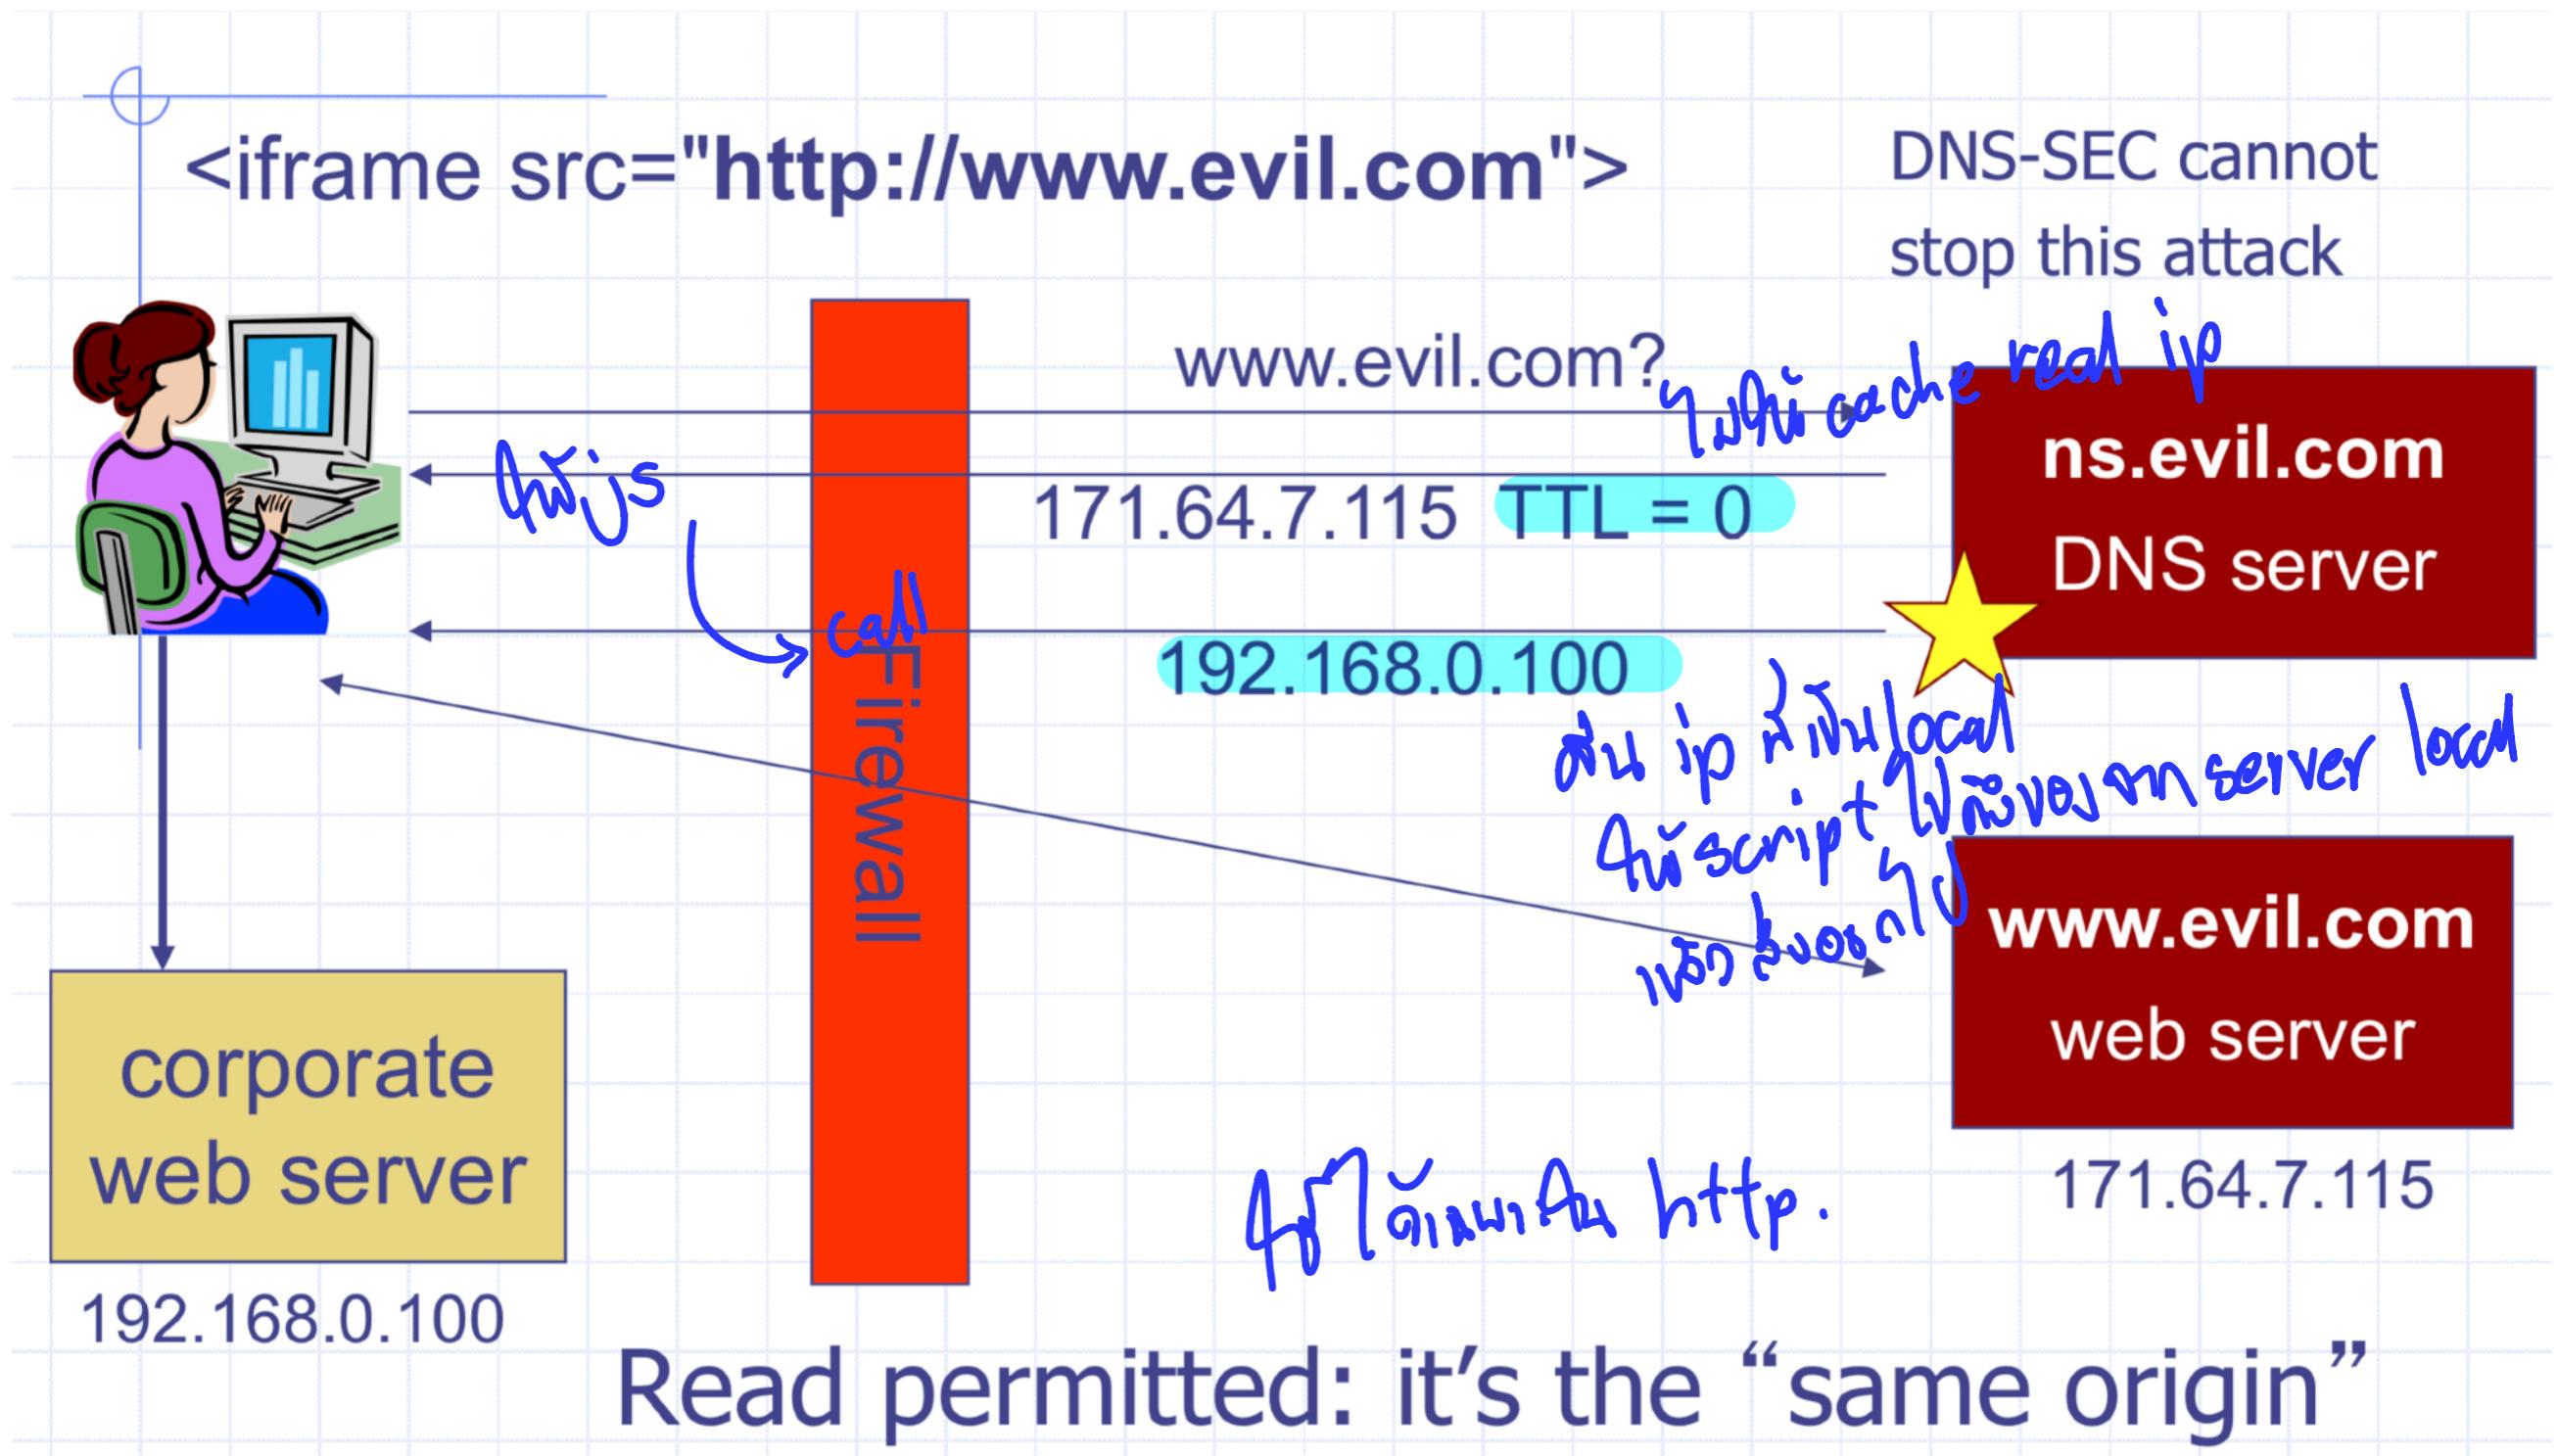

## DEFENSES?

- ▶ Increase QueryID space. But how? Don't want to change packet.  
↳ សម្រាប់ពាណិជ្ជកម្ម protocol  
*Q5 contains 16 bits*
- ▶ Randomize src port, additional bits of entropy  
↳ from fixed
- ▶ Attack now takes several hours

# DNS REBINDING

# DEFENSES?

# REBINDING DEFENSES

ការពារនៃការបង្កើត

## ▶ Browser Mitigations:

- ▶ Refuse to switch IPs mid session ពីរមិនអាចដោលបានបាន
- ▶ Interacts poorly with proxies, VPNs, CDNs, etc
- ▶ Not consistently implemented in any browser

## ▶ Server Defenses

- ▶ Check Host header for unrecognized domains
- ▶ Authenticate users with something else beyond IP address

## ▶ Firewall defenses

- ▶ External names can't resolve to internal addresses
  - ▶ Protects browsers inside the organization
- ▶ DNSSEC will not solve this problem

**DNSSEC** : ក្នុងក្រុមហ៊ុន, ការលំរាត

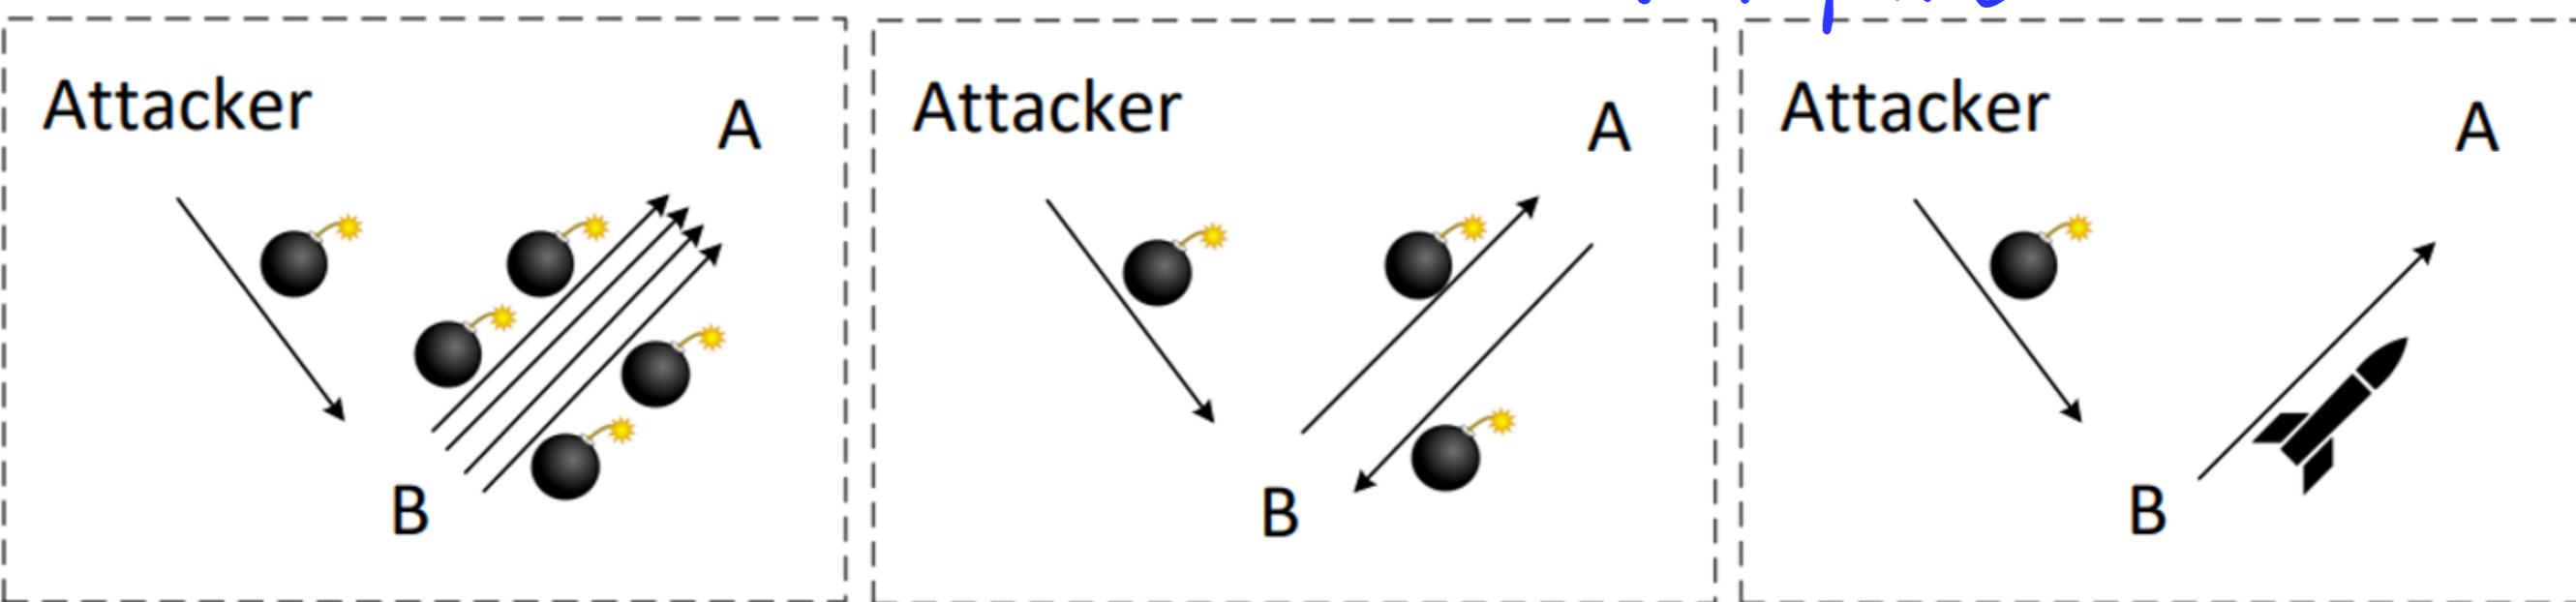

↳ ក្រុមហ៊ុន : ក្រុមហ៊ុន, ក្រុមហ៊ុន

- ▶ Adds authentication and integrity to DNS responses
- ▶ Authoritative DNS servers sign DNS responses using cryptographic key
- ▶ Clients can verify that a response is legitimate by checking signature through PKI similar to HTTPS
- ▶ Most people don't use DNSSEC and never will. Use TLS instead.

## UDP ATTACKS

- ▶ Mostly used for Denial-Of-Service (DOS) Attacks
- ▶ Strategies: amplify attacking power, "amplification"

ԳՐԱՅԻՆ ԽՈՎԱԿԱԿԱՆ ՄԱՍԻՆ

(a) Turn one grenade into  
many grenades

Smurf, Frggle

ԹԱՇՎԱՐԴԱՐ

(b) Create a regenerable  
grenade

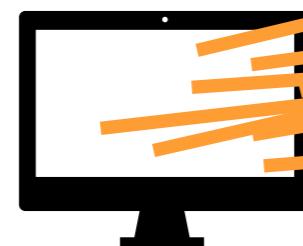

UDP Ping-Pong / վեցակնչական  
Infinite

(c) Turn a grenade into a  
missile

Amplification

# DOS

## Attacker

- ▶ Goal: take large site offline by overwhelming it with network traffic such that they can't process real requests
- ▶ How: find mechanism where attacker doesn't have to spend a lot of effort, but requests are difficult/expensive for victim to process
  - ▶ Design flaw that allows one machine to disrupt a service or implementation bug
  - ▶ Generally a protocol asymmetry, e.g., easy to send request, difficult to create response. Or requires server state.
  - ▶ Many exploits using popular protocols such as DNS, TCP, ICMP

## DISTRIBUTED DENIAL OF SERVICE

DDOS

Target

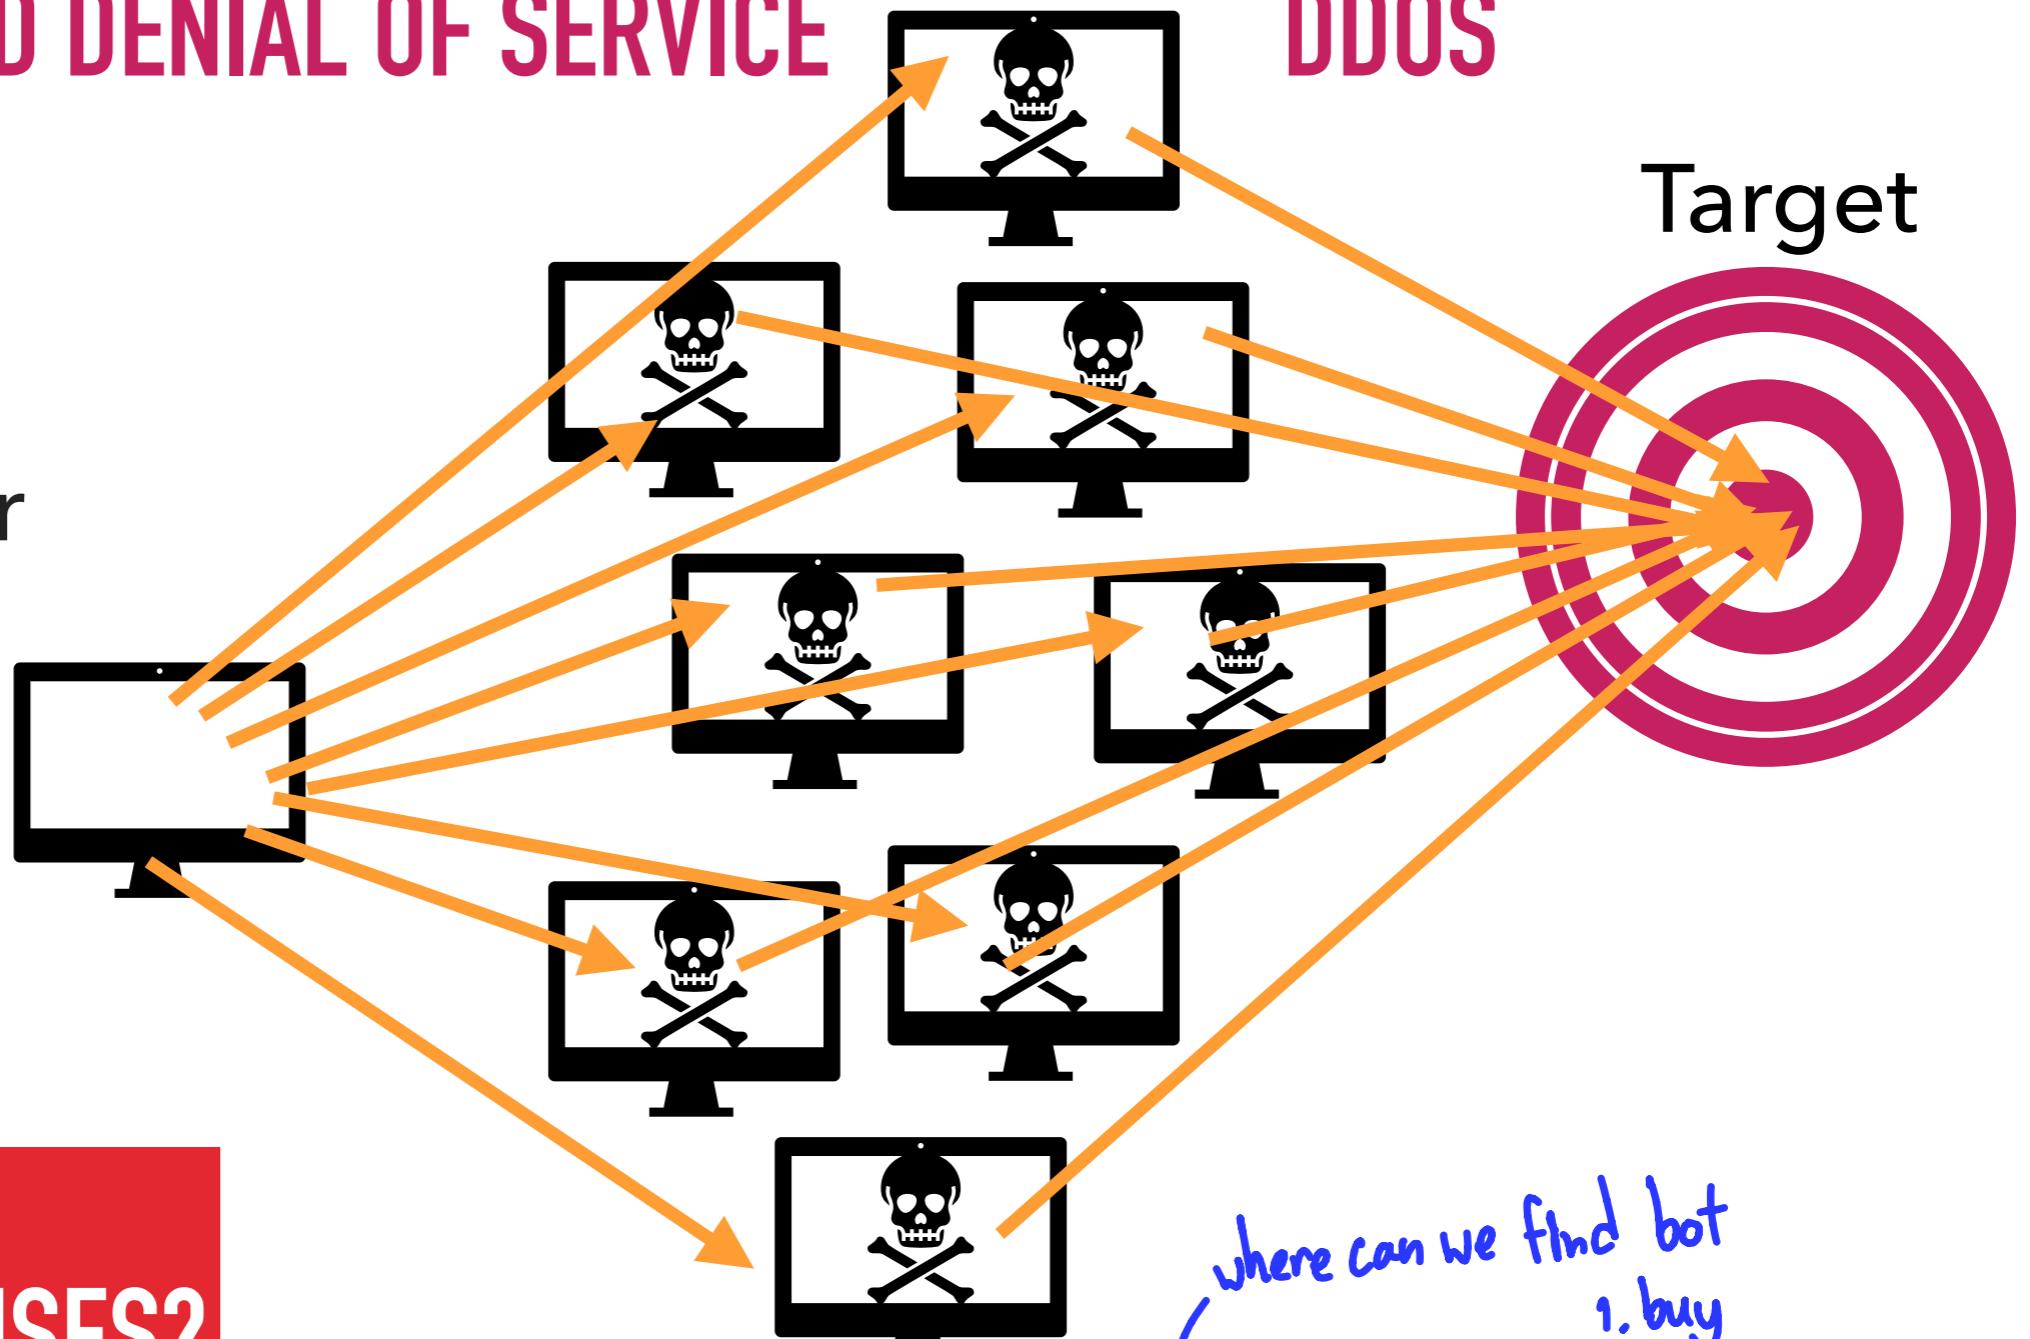

Attacker

DEFENSES?

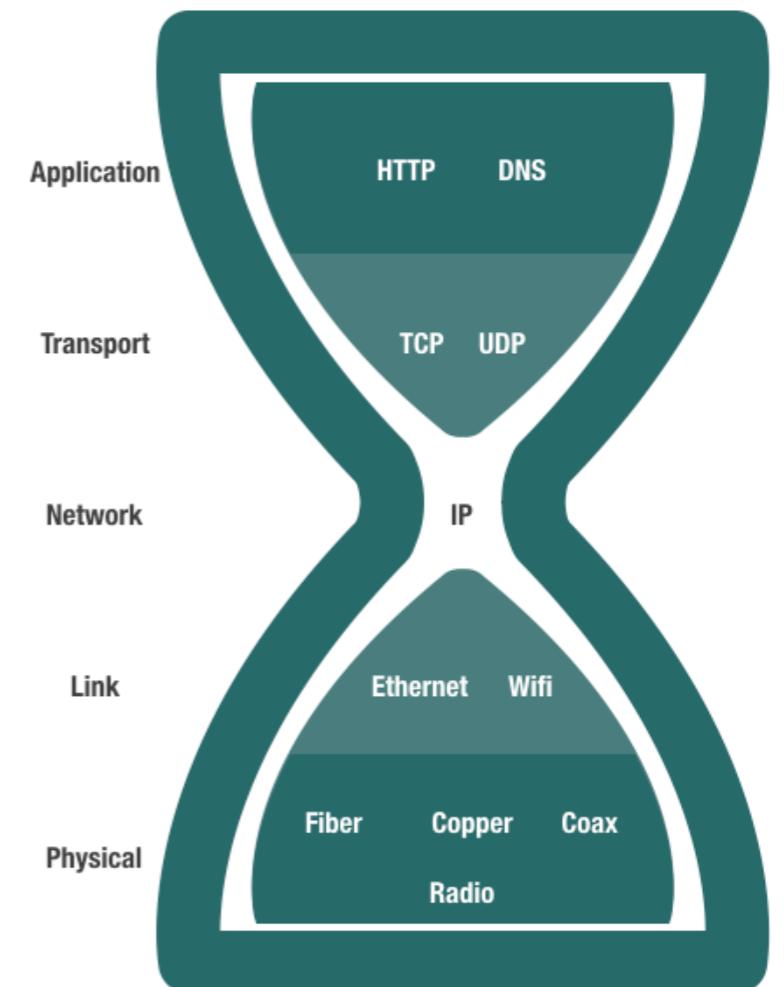

Zombies/Bots

where can we find bot  
1. buy  
2. recruitment

## DENIAL OF SERVICE POSSIBLE AT EVERY LAYER

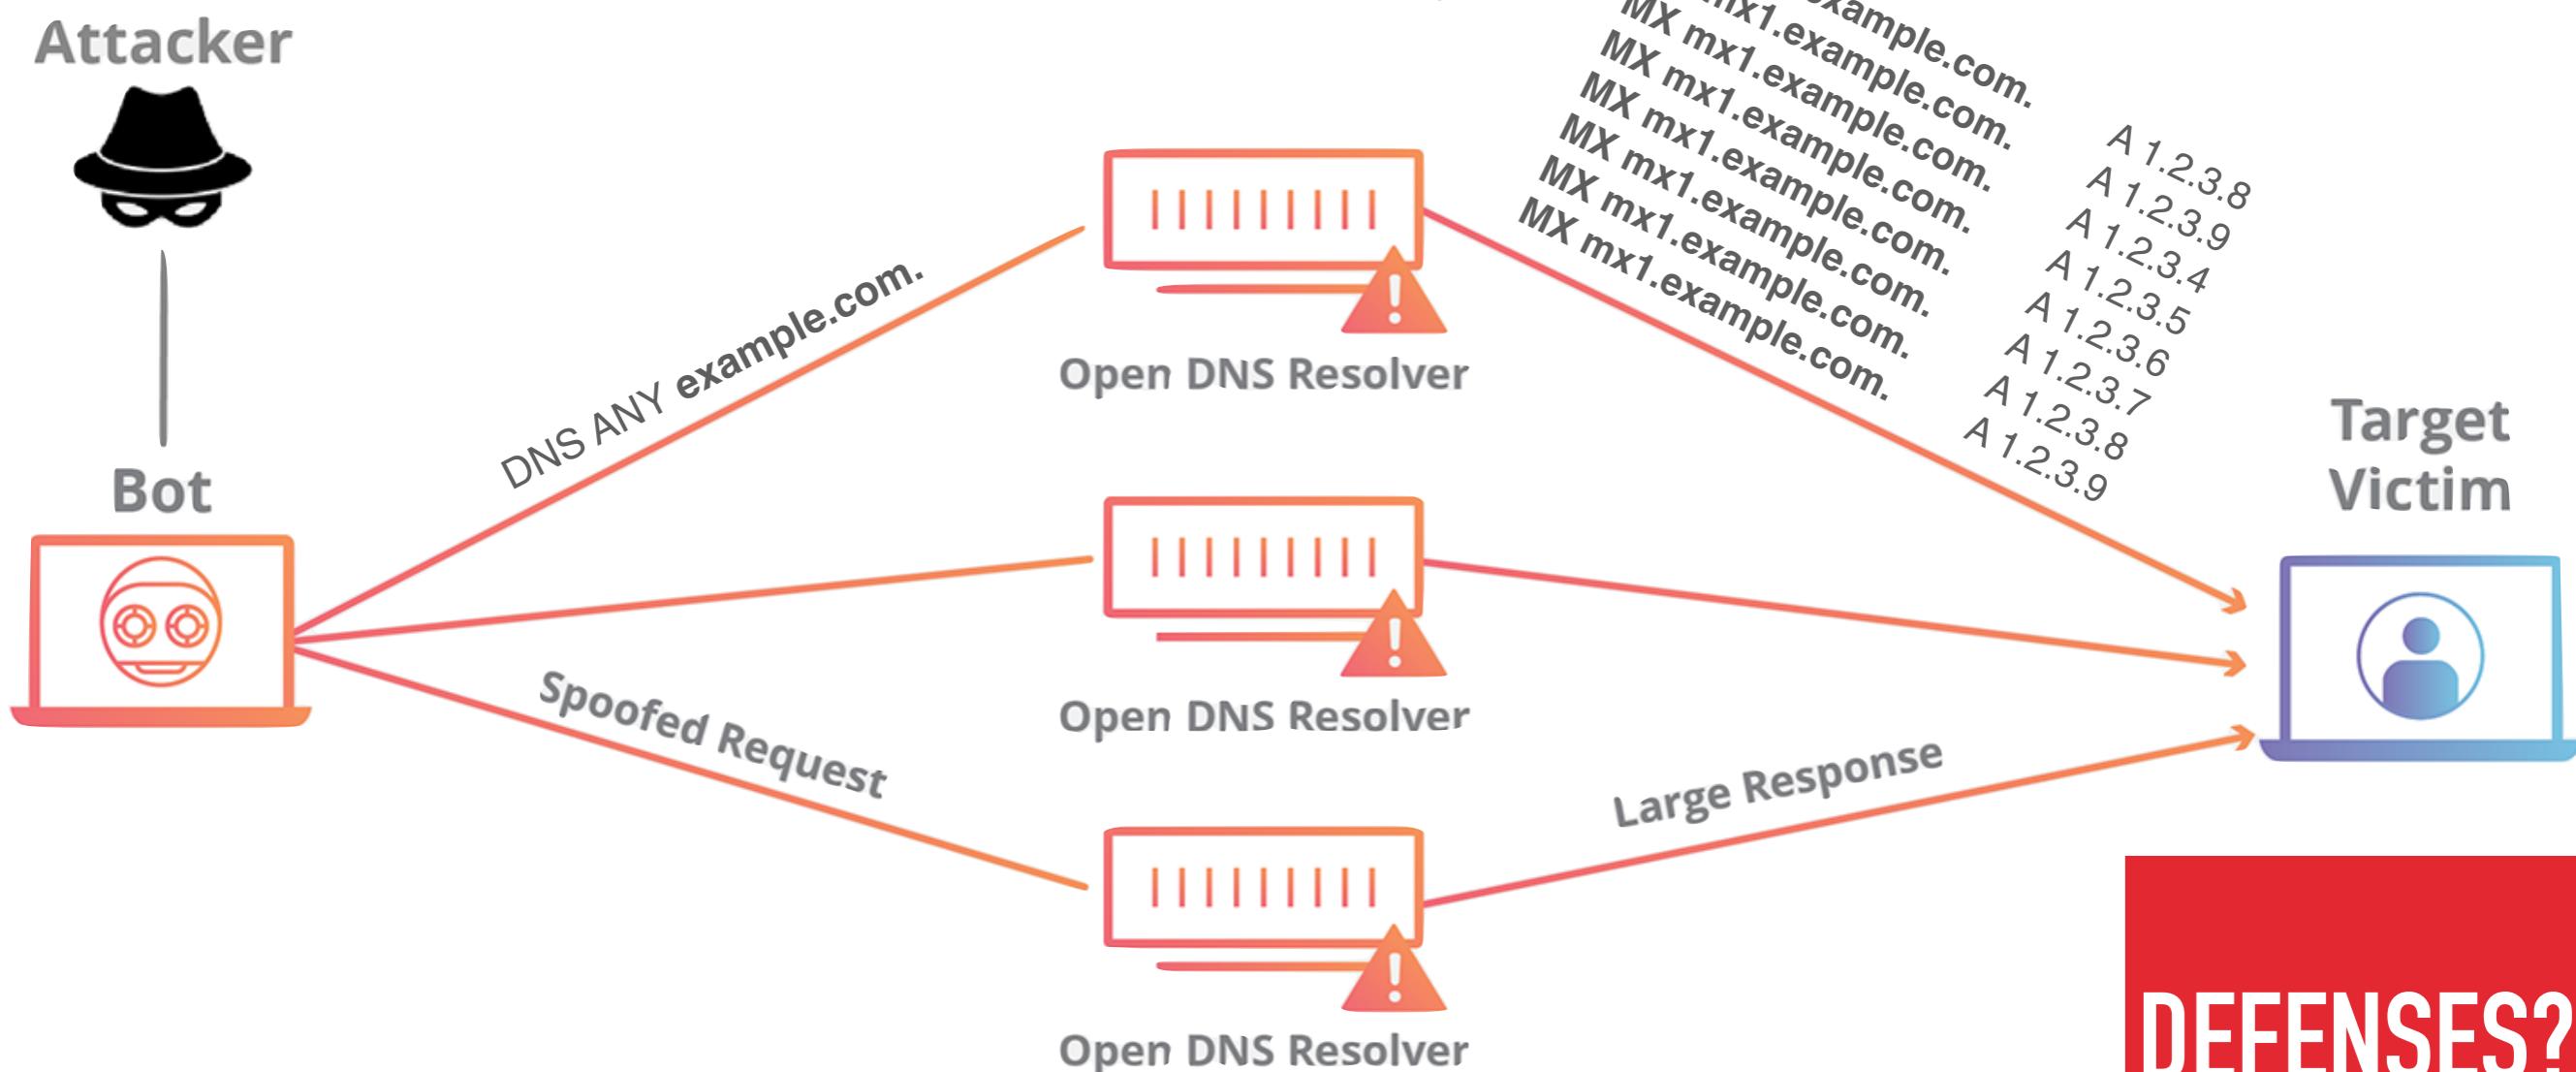

- ▶ Application Layer: require servers to perform expensive queries or  cryptographic operations
- ▶ TCP/UDP: require servers to maintain large number of concurrent connections or state  info state 104 300 300 300 300
- ▶ Link Layer: send too much traffic for switches/routers to handle

# DDOS AMPLIFICATION + REFLECTOR ATTACKS

សាខាអ៊ីរាជការណ៍នៅក្នុងរាជរដ្ឋមាន

199 source ip 199 victim ip

# 60-70x Increase in Size

# DEFENSES?

Keep in mind....

**SECURITY PROBLEM  
INHERENT IN THE DESIGN  
“PROTOCOL-LEVEL PROBLEM” VS.  
IMPLEMENTATION PROBLEM “BUG”**

## COMMON UDP AMPLIFIERS

- ▶ DNS: ANY query returns all records server has about a domain
- ▶ NTP: MONLIST returns list of last 600 clients who asked for the time recently
- ▶ Only works if you can receive a big response by sending a single packet – otherwise spoofing doesn't lead to effective DoS attacks.

## AMPLIFICATION ATTACKS

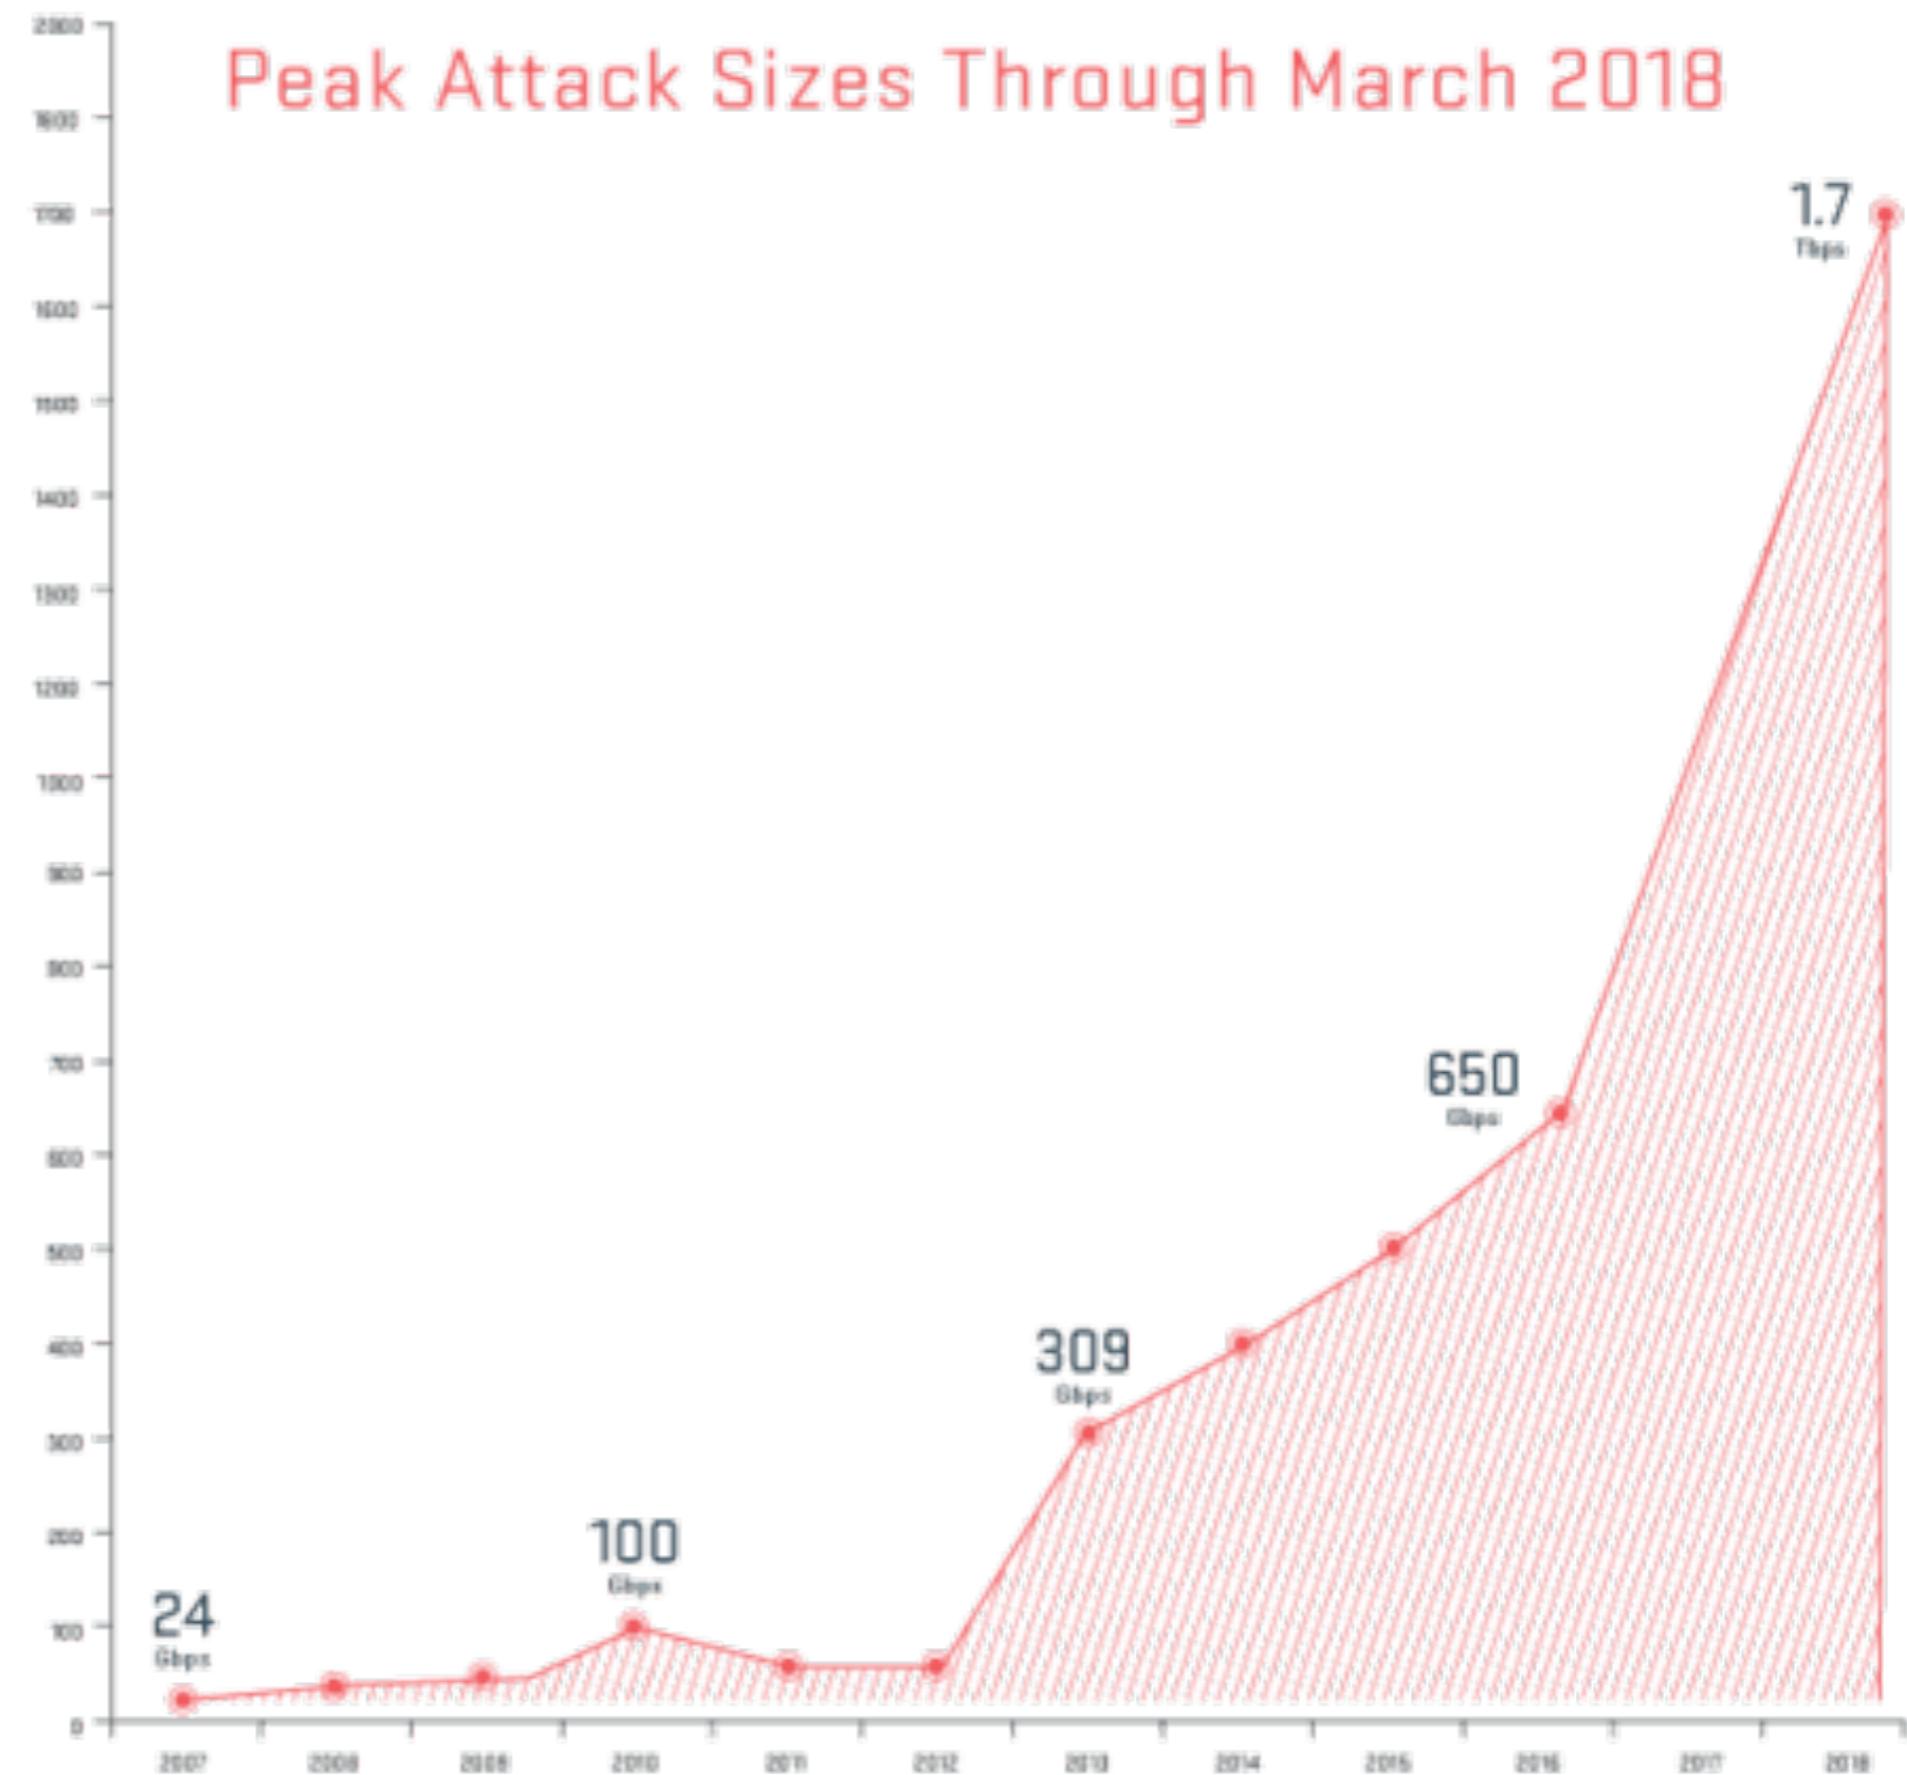

- ▶ 2013: DDoS attack generated 300 Gbps (DNS)
  - ▶ 31,000 misconfigured open resolvers, each at 10 Mbps
  - ▶ Source: 3 networks that allowed IP spoofing
- ▶ 2014: 400 Gbps DDoS attacked used 4500 NTP servers

# AMPLIFICATION FACTOR

| Protocol               | Bandwidth Amplification Factor | Vulnerable Command           |
|------------------------|--------------------------------|------------------------------|
| DNS                    | 28 to 54                       | see: TA13-088A [4]           |
| NTP                    | 556.9                          | see: TA14-013A [5]           |
| SNMPv2                 | 6.3                            | GetBulk request              |
| NetBIOS                | 3.8                            | Name resolution              |
| SSDP                   | 30.8                           | SEARCH request               |
| CharGEN                | 358.8                          | Character generation request |
| QOTD                   | 140.3                          | Quote request                |
| BitTorrent             | 3.8                            | File search                  |
| Kad                    | 16.3                           | Peer list exchange           |
| Quake Network Protocol | 63.9                           | Server info exchange         |
| Steam Protocol         | 5.5                            | Server info exchange         |
| Multicast DNS (mDNS)   | 2 to 10                        | Unicast query                |
| RIPv1                  | 131.24                         | Malformed request            |
| Portmap (RPCbind)      | 7 to 28                        | Malformed request            |
| LDAP                   | 46 to 55                       | Malformed request [6]        |

## MEMCACHE

- ▶ Memcache: retrieve large record
- ▶ The server responds by firing back as much as 50,000 times the data it received.
- ▶ Exist both a UDP and TCP version. Only works for UDP! TCP would require a three-way handshake and server would realize IP had been spoofed.

October 21, 2016

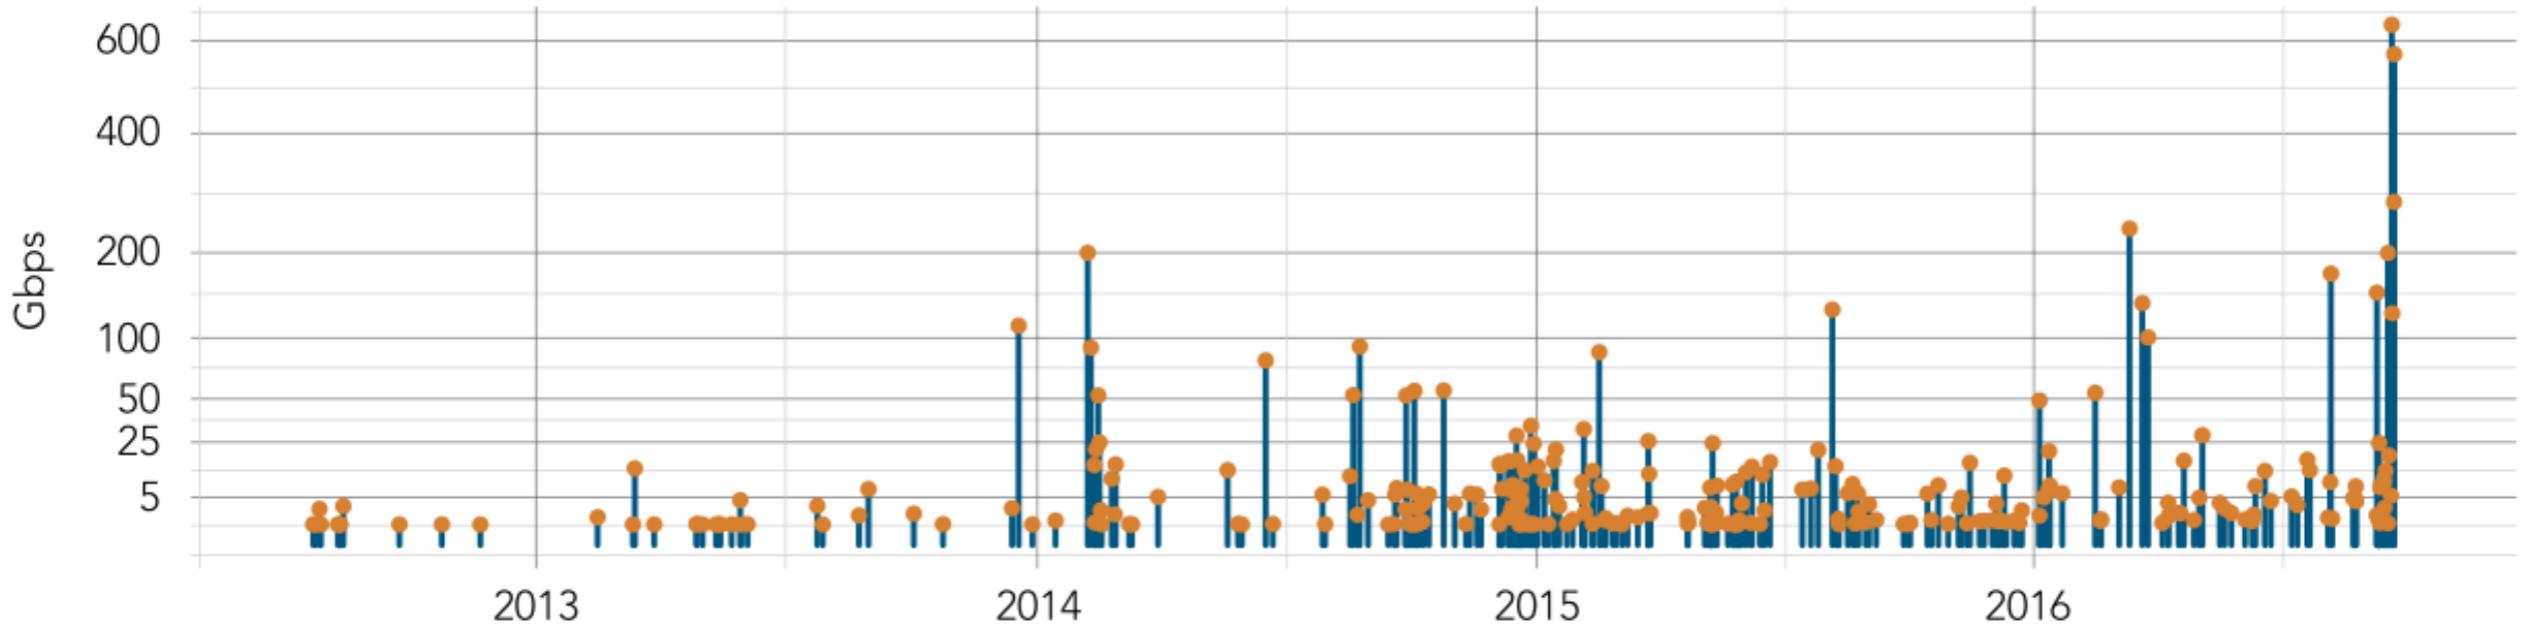

THE WALL STREET JOURNAL.

# Cyberattack Knocks Out Access to Websites

Popular sites such as Twitter, Netflix and PayPal were unreachable for part of the day

Attack on Dyn (DNS service provider)

“The magnitude of the attacks seen during the final week were significantly larger than the majority of attacks Akamai sees on a regular basis. [...] In fact, while the attack on September 20 was the largest attack ever mitigated by Akamai, the attack on September 22 would have qualified for the record at any other time, peaking at 555 Gbps.”

“We are still working on analyzing the data but the estimate at the time of this report is up to 100,000 malicious endpoints. [...] There have been some reports of a magnitude in the 1.2 Tbps range; at this time we are unable to verify that claim.”

# A BOTNET OF IOT DEVICES

Not Amplification.  
Flood with SYN, ACK, UDP, and GRE packets

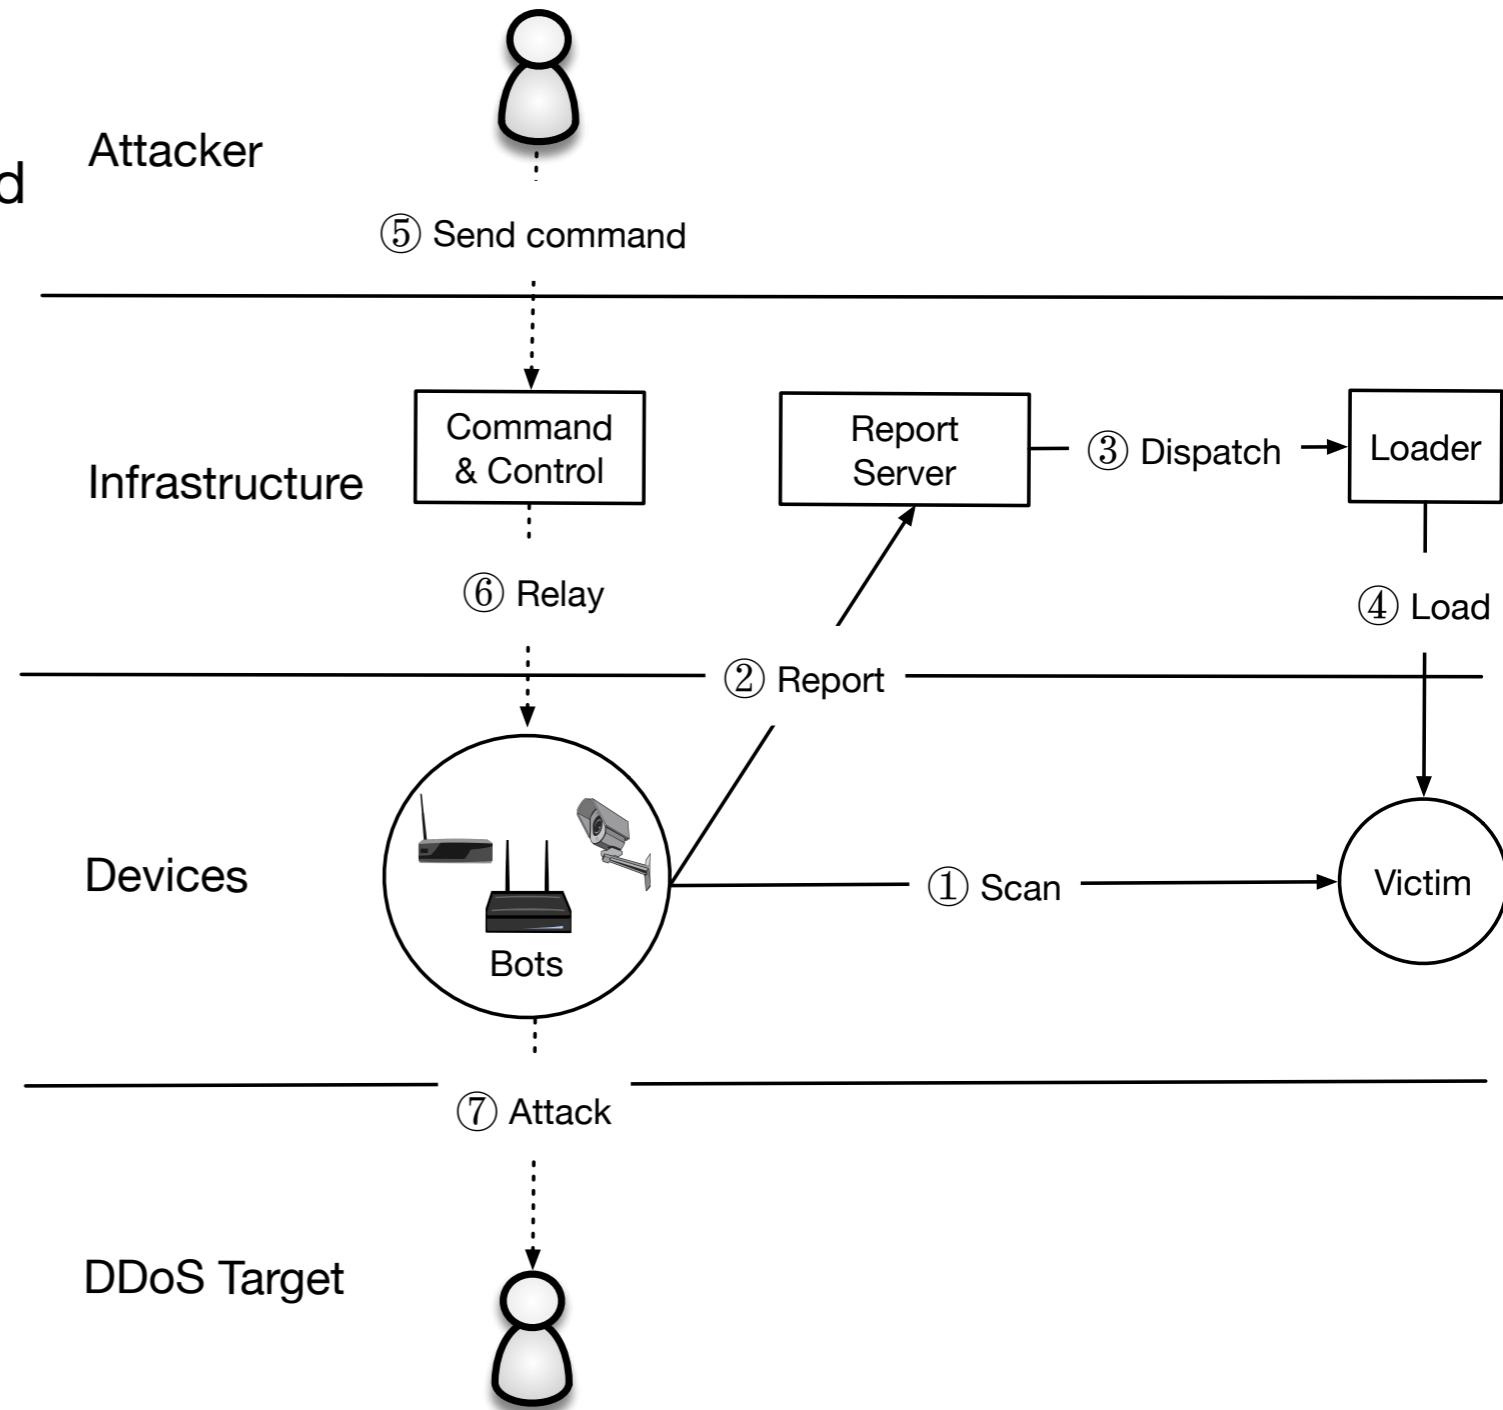

# THE MIRAI MALWARE

Steps 5-7. Later, the **bot master** will issue commands to pause scanning and to start an attack

## Attack Command:

- Action (e.g., START, STOP)
- Target IP(s)
- Attack Type (e.g., GRE, DNS, TCP)
- Attack Duration

DEFENSES?

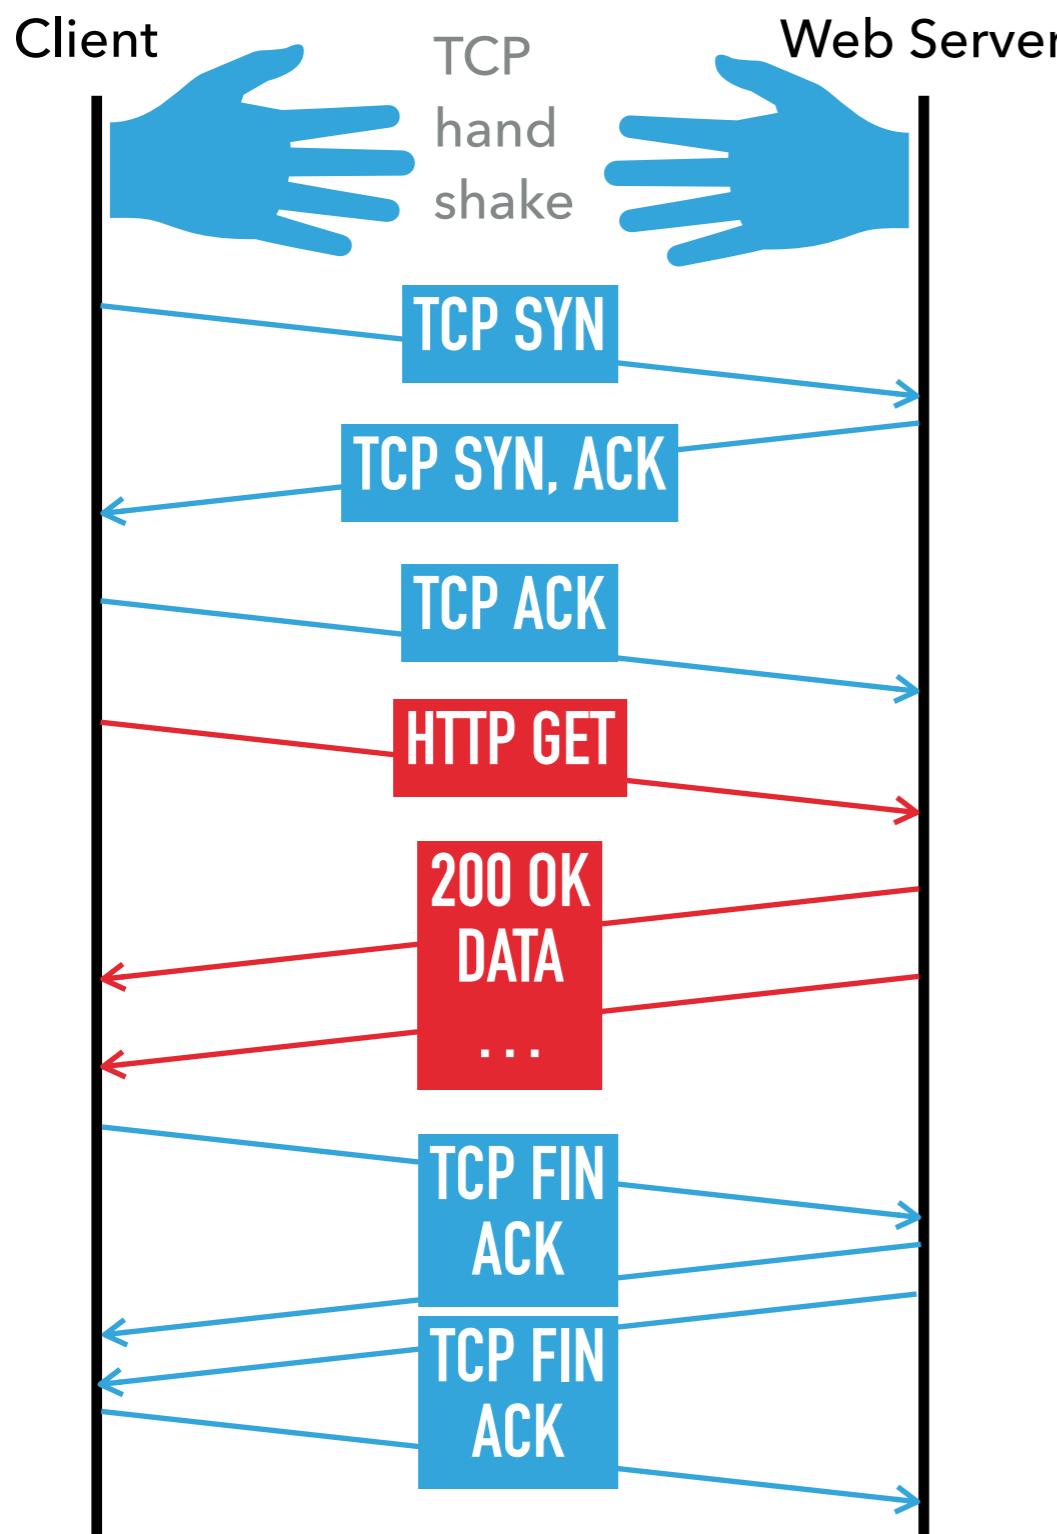

- 1. TCP SPOOFING**
  - 2. TCP RESET**
  - 3. SYN FLOOD ATTACK**
- 

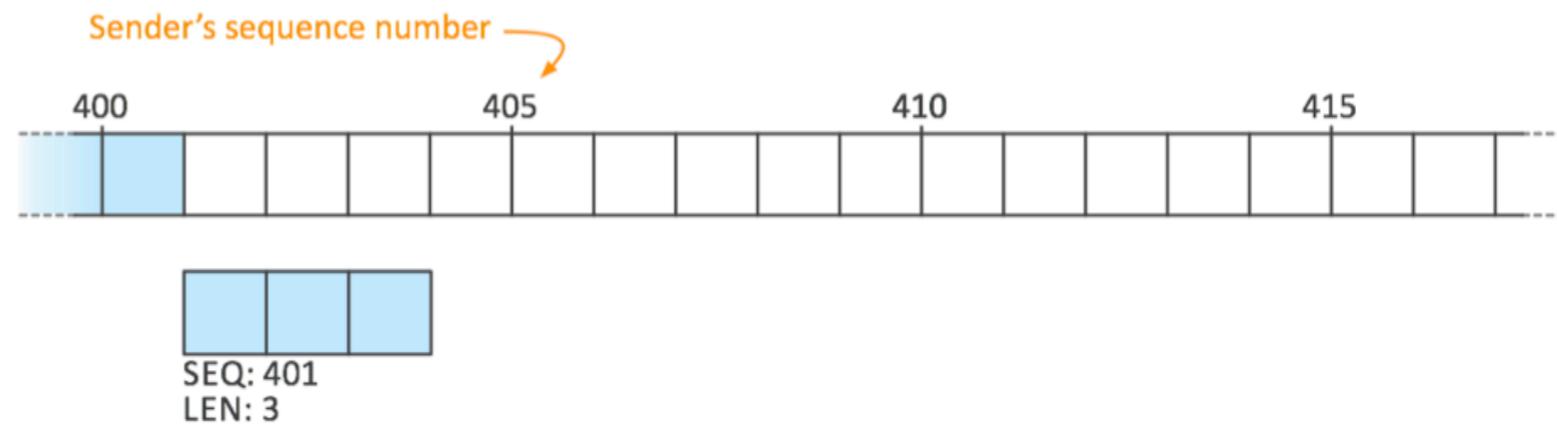

**TCP KNOWN ISSUES**

# TRANSMISSION CONTROL PROTOCOL (TCP)

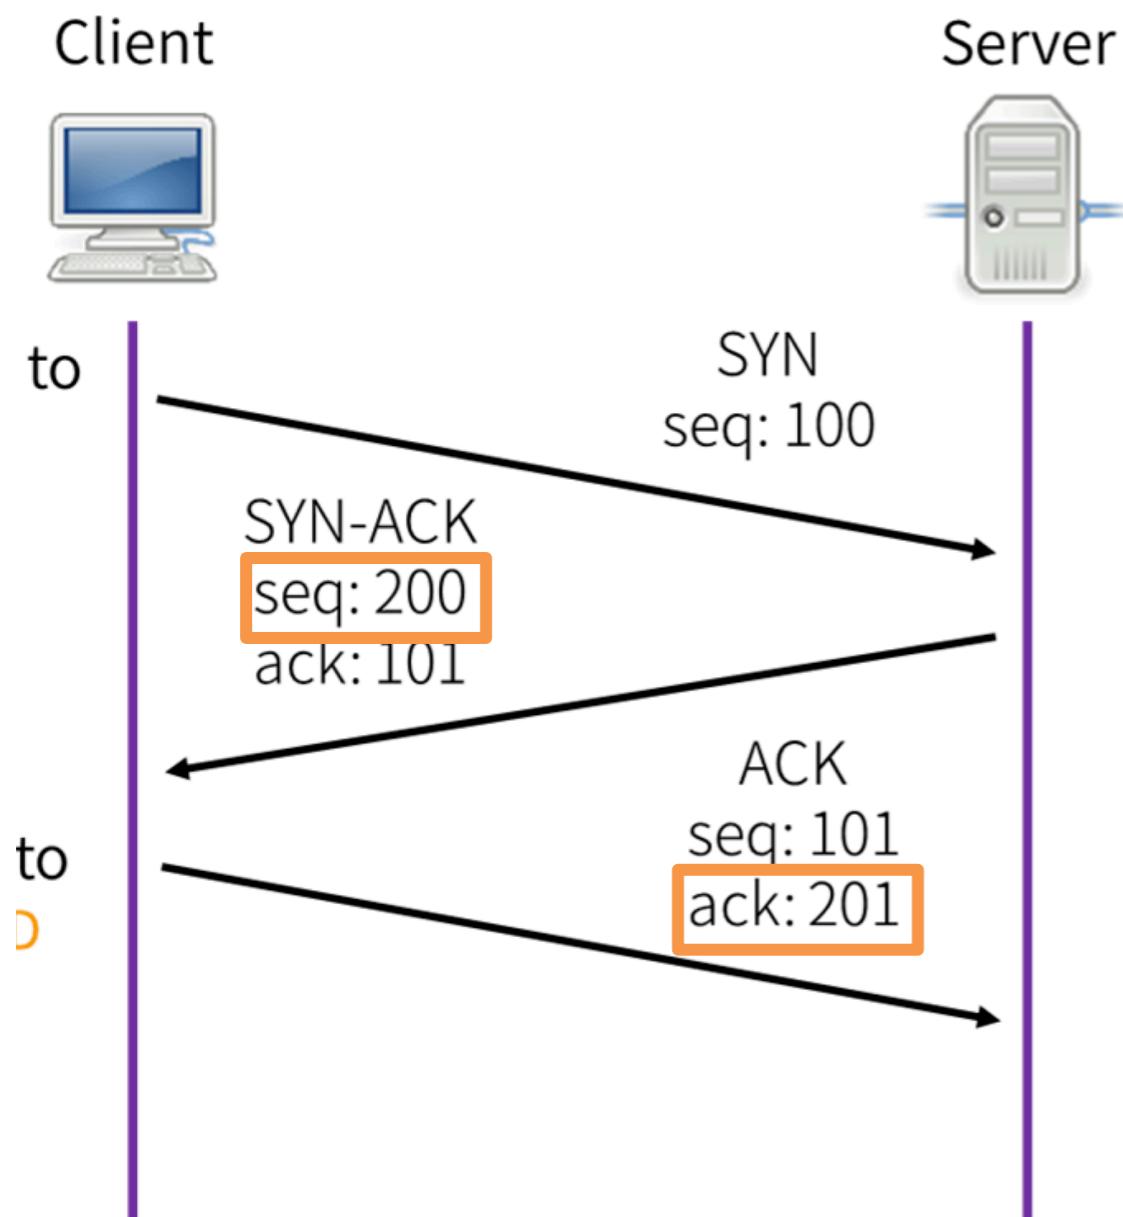

- ▶ Many applications want a stream of bytes delivered reliably and in-order between applications on different hosts
- ▶ Transmission Control Protocol (TCP) provides...
- ▶ Connection-oriented protocol with explicit setup/teardown
- ▶ Reliable in-order byte stream
- ▶ Congestion control
- ▶ Despite IP packets being dropped, re-ordered, and duplicated (i.e., IP is best effort)

## TCP SEQUENCE NUMBERS

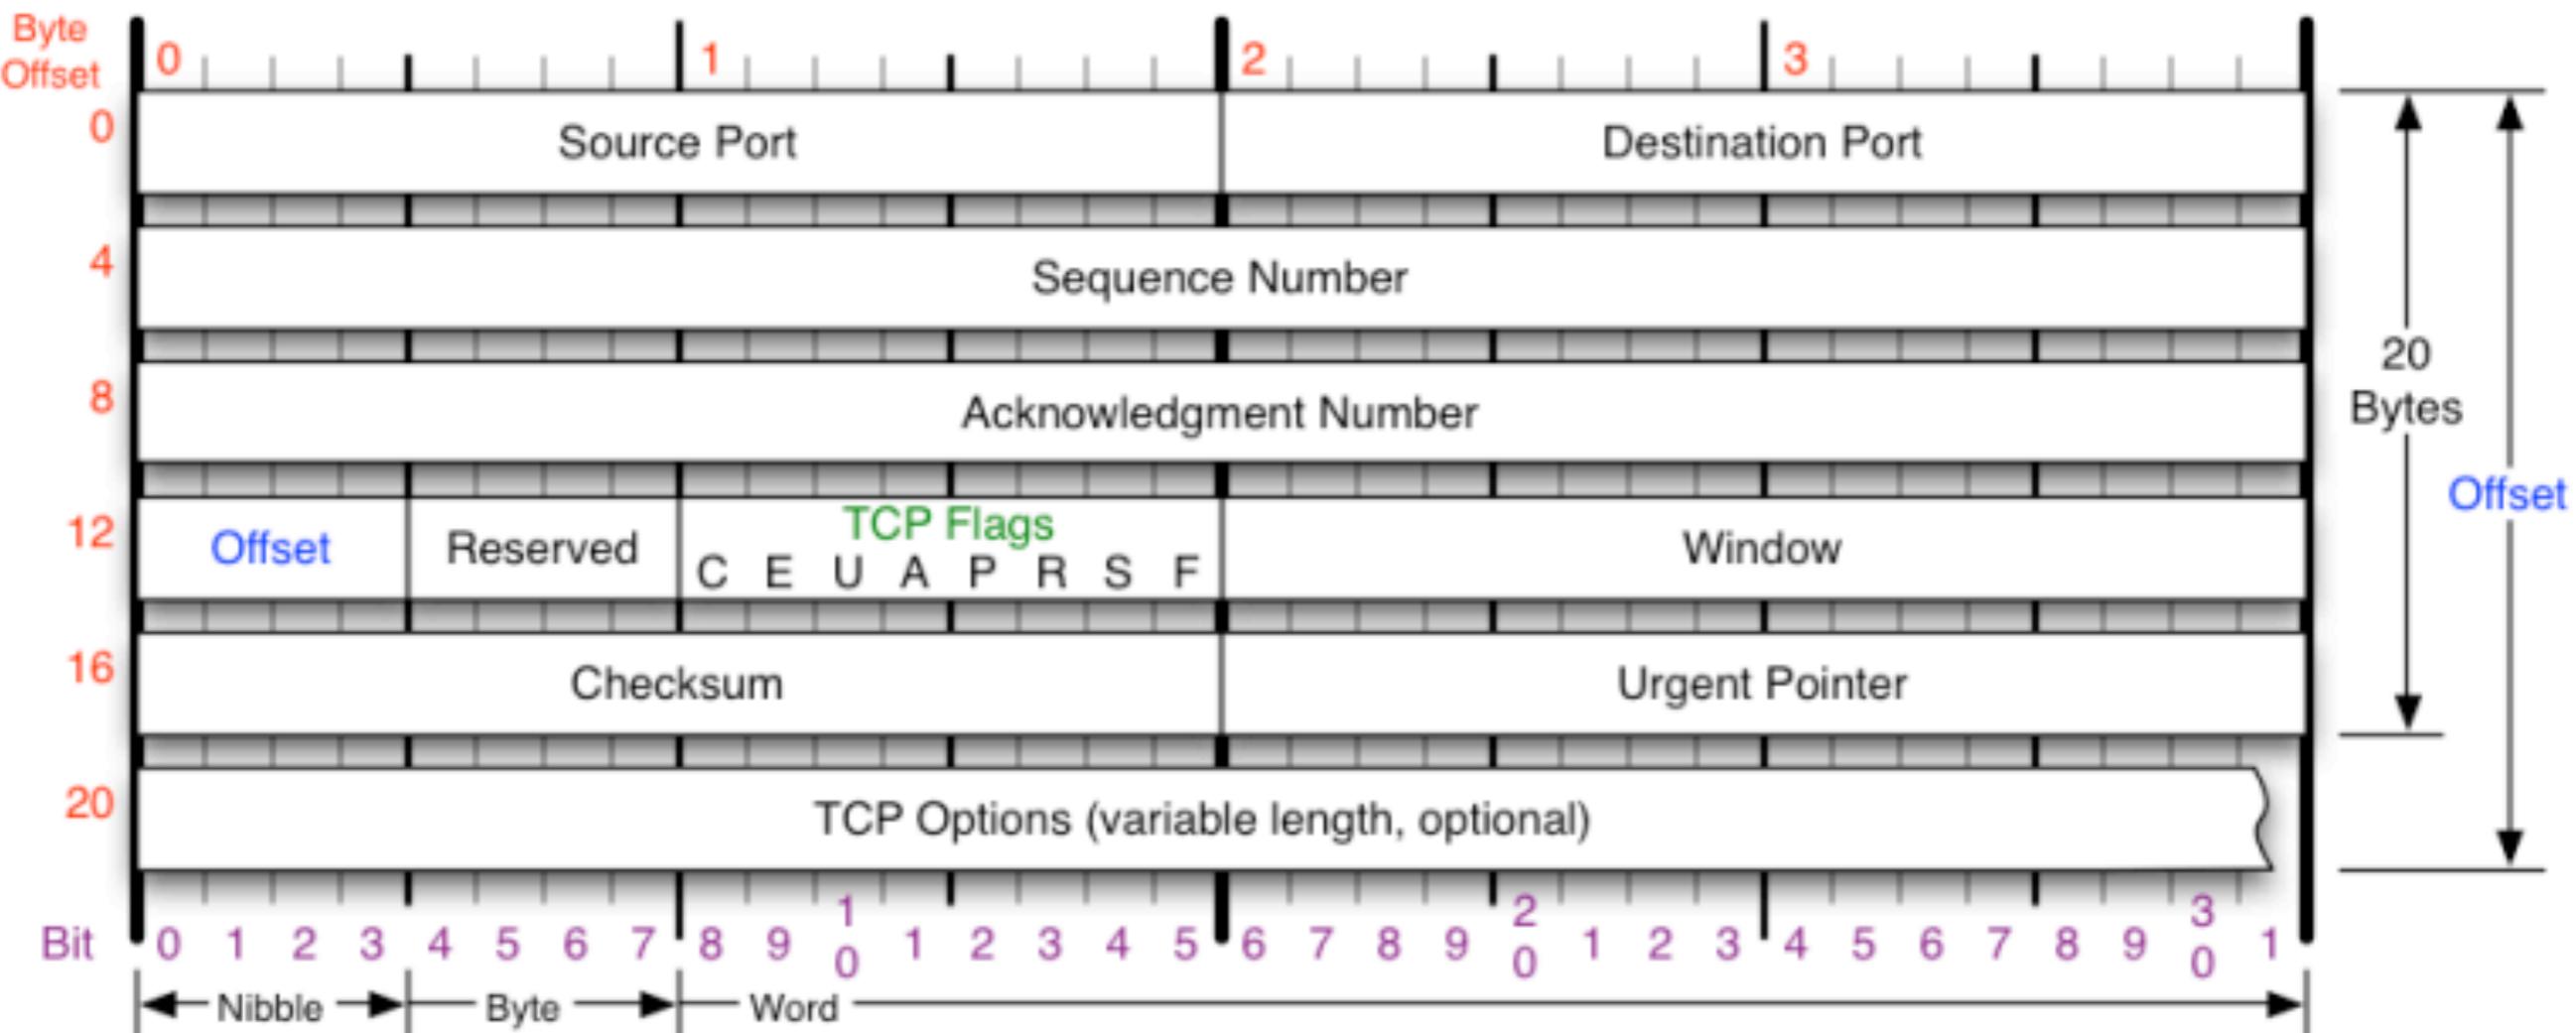

- ▶ Two data streams in a TCP session, one in each direction
- ▶ Bytes in data stream numbered with a 32-bit sequence number
- ▶ Every packet has sequence number that indicates where data belongs
- ▶ Receiver sends acknowledgement number that indicates data received

# CAN WE IMPERSONATE ANOTHER HOST WHEN INITIATING A CONNECTION (AKA SPOOF TCP CONNECTIONS)?

- ▶ Off-path attacker can send initial SYN to server ..... but cannot complete three-way handshake without seeing the server's sequence number
- ▶  $1/2^{32}$  chance to guess right if initial sequence number chosen uniformly at random

# TRANSMISSION CONTROL PROTOCOL (TCP)

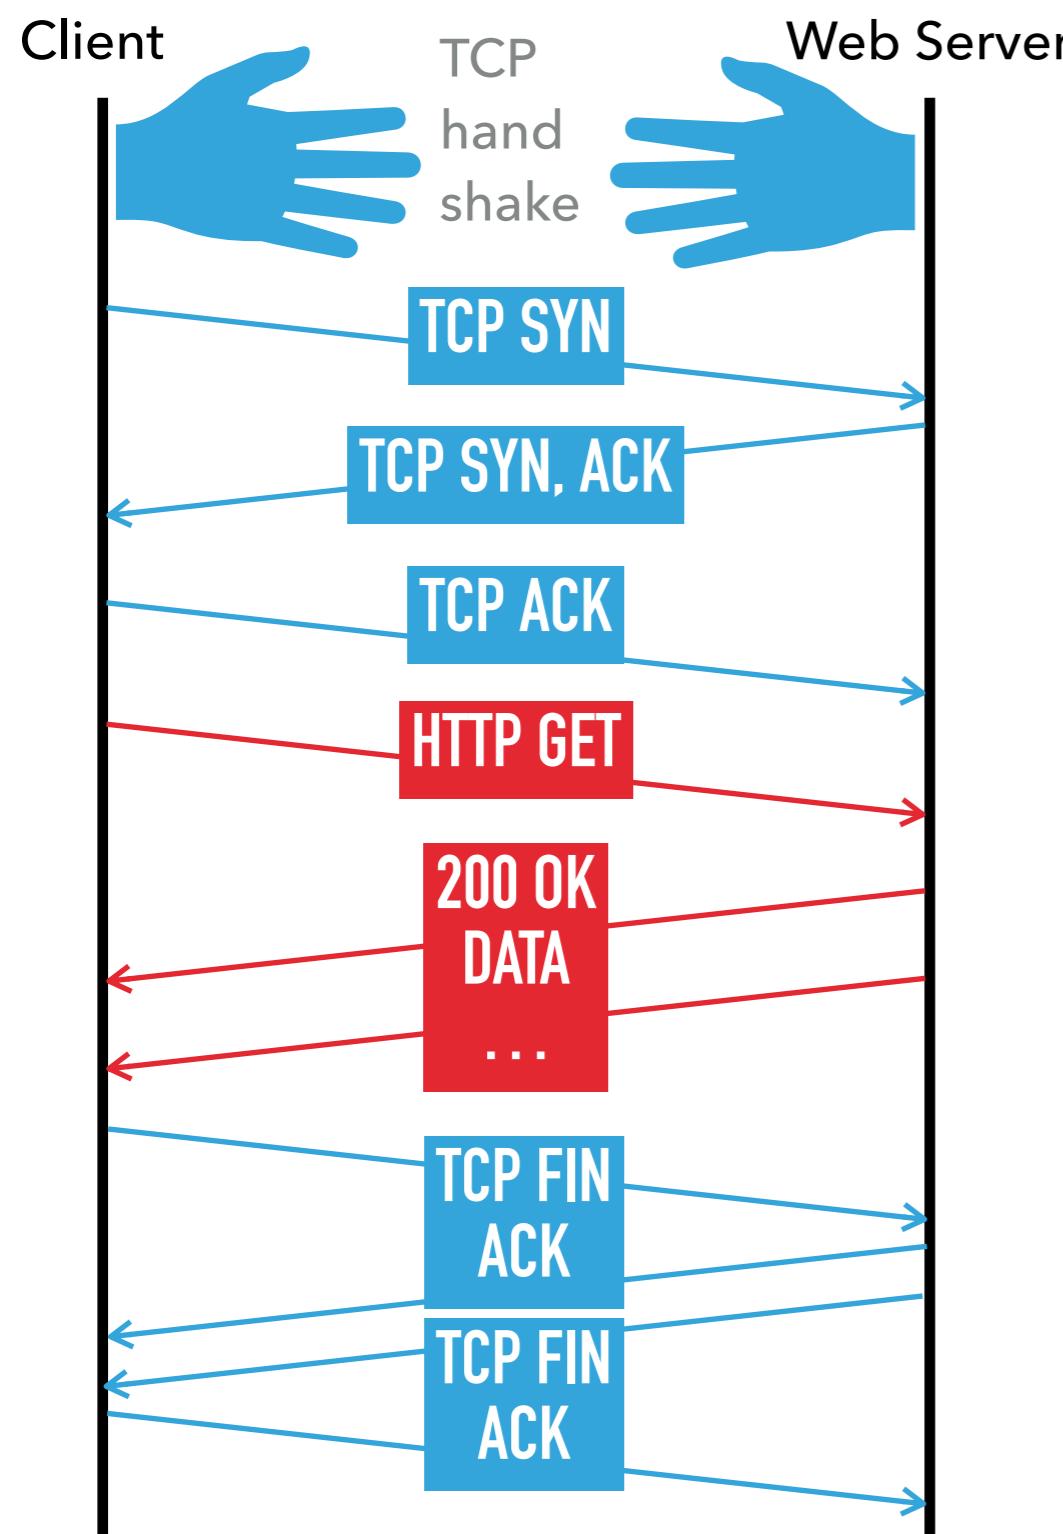

## TCP CONNECTION RESET

- ▶ TCP designed to handle possibility of spurious TCP packets (e.g. from previous connections)
- ▶ Packets that are invalid given current state of session generate a reset
  - ▶ If a connection exists, it is torn down
  - ▶ Packet with RST flag sent in response
- ▶ If a host receives a TCP packet with RST flag, it tears down the connection

## CAN WE RESET AN EXISTING TCP CONNECTION?

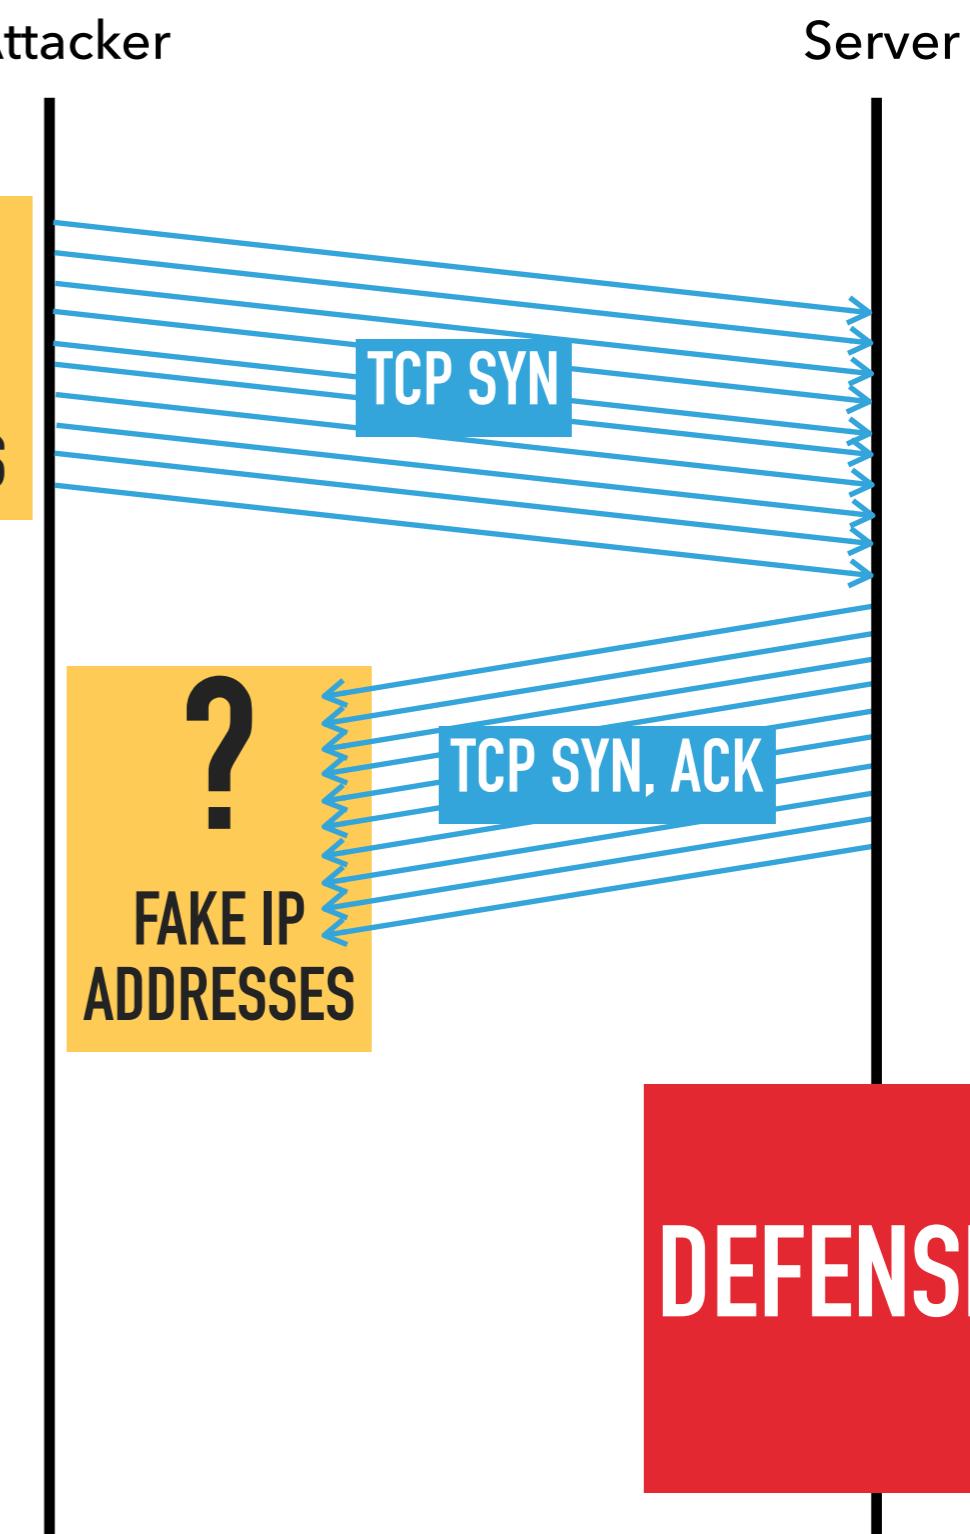

- ▶ Need to know port numbers (16 bits)
  - ▶ Initiator's port number usually chosen random by OS
  - ▶ Responder's port number may be well-known port of service
- ▶ There is leeway in sequence numbers B will accept
  - ▶ Must be within window size (32-64K on most modern OSes)
- ▶  $1 \text{ in } 2^{16+32}/W$  (where W is window size) chance to guess right

## TCP SYN FLOOD ATTACK (PART II)

Attacker

SPOOFED  
FAKE IP  
SOURCE  
ADDRESSES

Keep in mind....

**SECURITY PROBLEM  
INHERENT IN THE DESIGN  
“PROTOCOL-LEVEL PROBLEM” VS.  
IMPLEMENTATION PROBLEM “BUG”**

## GOOD VS. BAD SOLUTIONS FOR SYN FLOOD ATTACKS

- ▶ Problem: server commits resources (memory) before confirming identify of client (when client responds)
- ▶ Solutions?
  - ▶ Increase backlog queue size
  - ▶ Decrease timeout
  - ▶ Avoid state until 3-way handshake completes

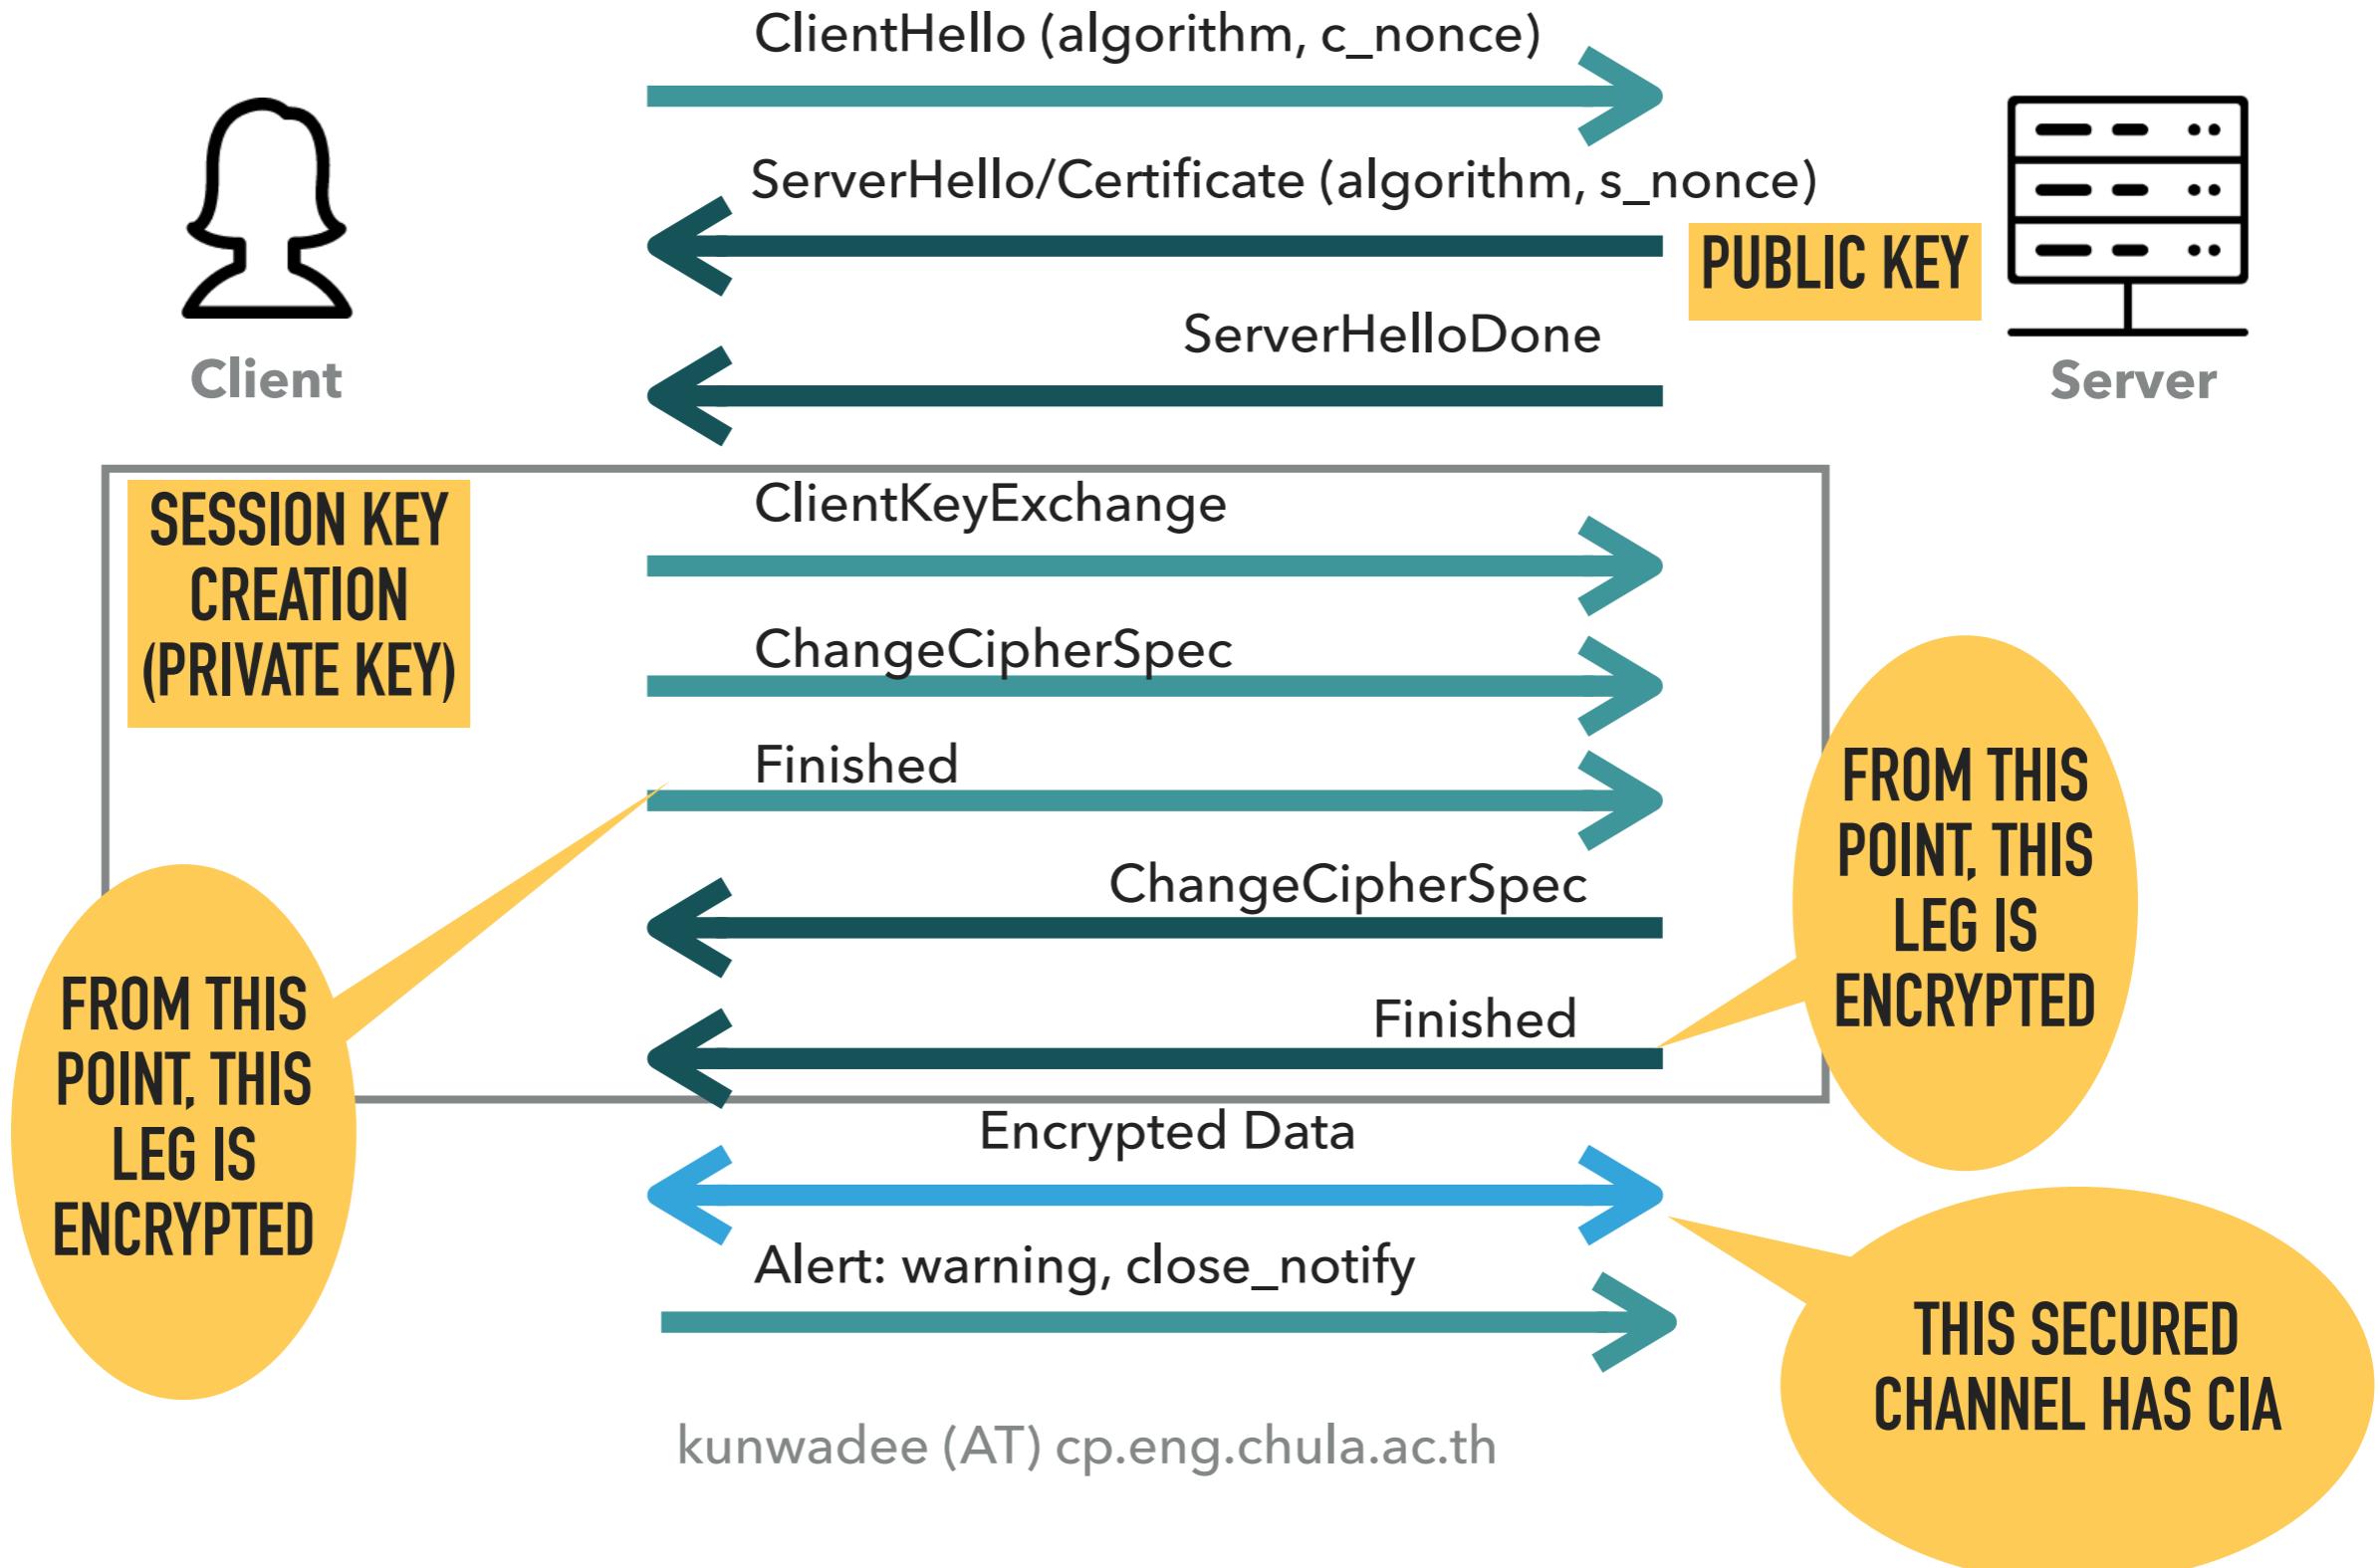

# 1. SSL HEART BLEED

---

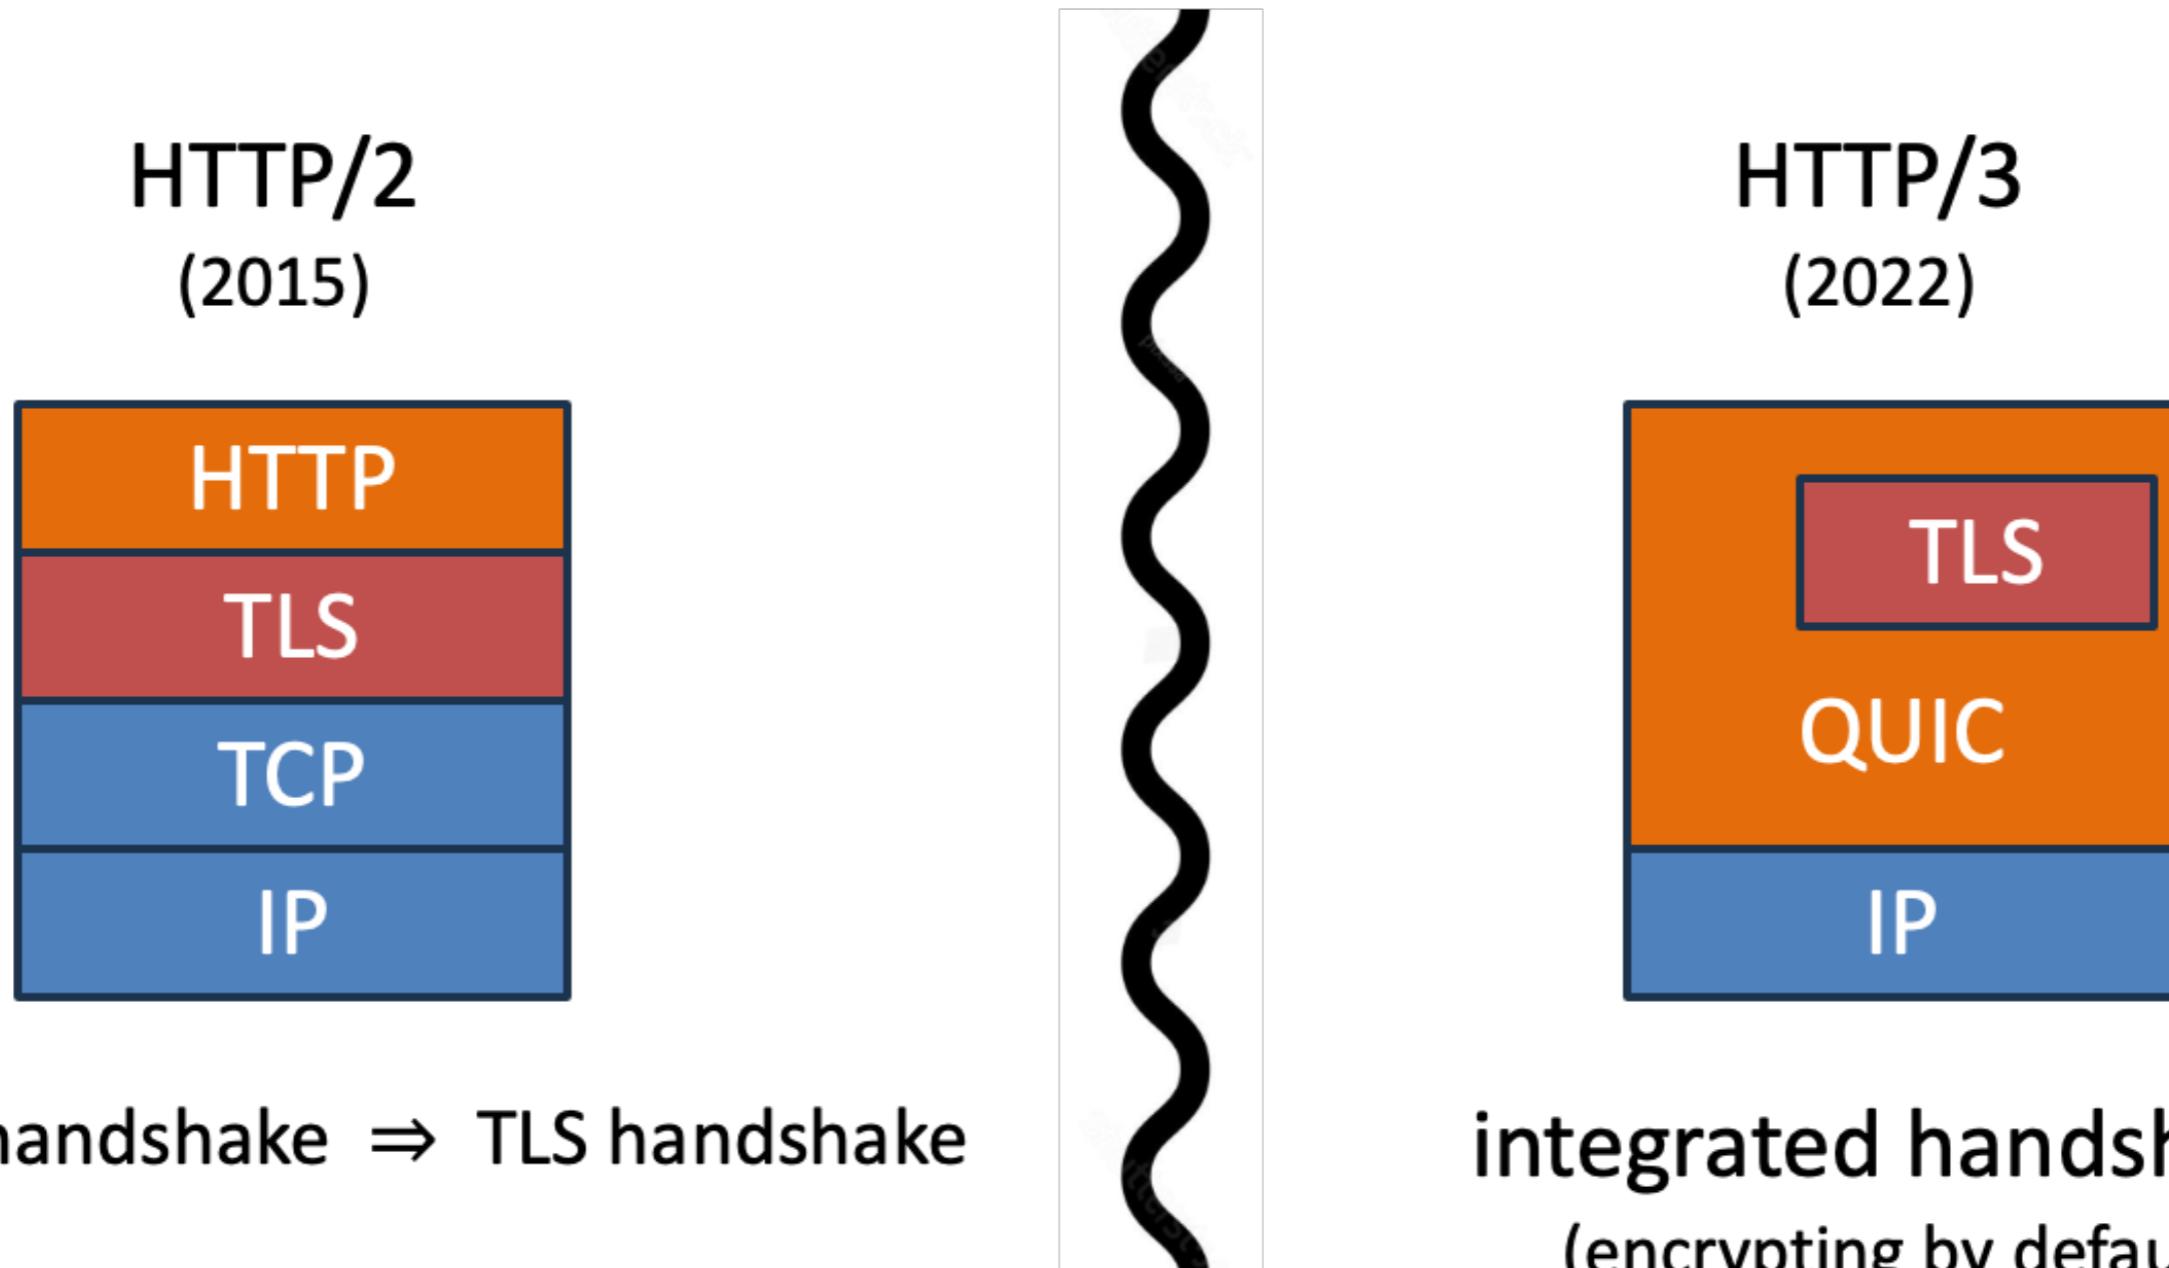

## SSL KNOWN ISSUES

kunwadee (AT) cp.eng.chula.ac.th

## ENCRYPTION WITH TLS/SSL

# INTEGRATING TLS WITH HTTP: HTTPS

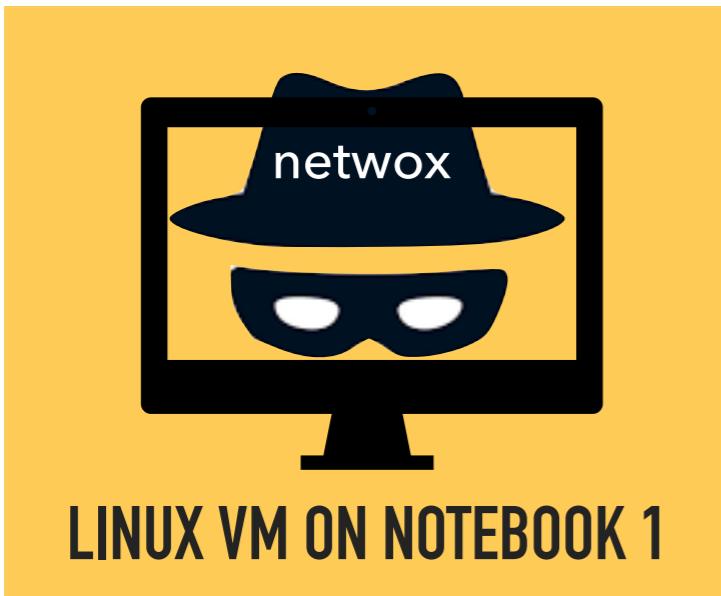

## TLS/SSL HEARTBLEED (PART III)

# ARE THERE NO DEFENSES, BUT ONLY WAYS TO IMPROVE SECURITY?

- ▶ Protocol-compatible fixes to TCP implementations.
- ▶ Firewalls.
  - ▶ Partial fix, but widely used.
  - ▶ Issue: adversary may be within firewalled network.
  - ▶ Issue: hard to determine if packet is "malicious" or not.
  - ▶ Issue: even for fields that are present (src/dst), hard to authenticate.
- ▶ TCP/IP's design not a good match for firewall-like filtering techniques.
  - ▶ E.g., IP packet fragmentation: TCP ports in one packet, payload in another.
- ▶ Implement security on top of TCP/IP: SSL/TLS, Kerberos, SSH, etc.
- ▶ Use cryptography (encryption, signing, MACs, etc).
  - ▶ Quite a hard problem: protocol design, key distribution, trust, etc.
- ▶ Some kinds of security hard to provide on top: DoS-resistance, routing.
- ▶ Deployment of replacement protocols: SBGP, DNSSEC.
